REFERENCES

For more information on the newsgroup creation procedures, refer to the
article "Guidelines for UseNet Newsgroup Creation" in news.groups,
news.announce.newgroups and news.answers. It includes the requirements behind
the rules in this CFV including, for example, voting by mail only, the allowed
length of the voting period, required margins to pass, prohibition against
proxy, forwarded, or conditional votes, etc.

For a complete transcript of the decision-making process that led up to the Request for Discussion and Call for Votes for the rec.radio.amateur reorganization, anonymous FTP to charon.amdahl.com and obtain the files called
/pub/radio/amateur/news.groups-discussion.Z
/pub/radio/amateur/rra-reorg.log.*.Z
The newsgroups on this CFV were the result of the 30-day discussion period that followed the Request for Discussion (which was posted March 25, 1993.)

The rra-reorg mail list was the forum for developing the RFD and for turning the results of the discussion on news.groups into this CFV. The mail list was advertised several times on the rec.radio.amateur.* newsgroups. The following people chose to join and assisted in putting together the proposal:

3232. Alinco 600 mobile rig (Questions)

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-27 22:34:28 UTC
From: erik@peewee.nwc.navy.mil
Message-ID: <C7pIpG.Kow@avalon.nwc.navy.mil>
Source record: 280963

I understand that the newer ones include the DSQ decode so remote control is standard. I have heard that one should not configure a dual-band using cross-band repeat to link to a repeater. It would seem that this is the one really useful feature of a remote control, cross-band unit. What gives?

To anyone who ownes a 600 out there, I am considering the purchase and would appreciate any advice, comments, etc. Are there any mods to provide extended coverage? I have a dual band Larsen antenna already. Is there a duplexer built in to the 600? If not is there an Alinco accessory for this?

73 and thanks

3233. GMRS; type acceptance question

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-27 22:40:40 UTC
From: erik@peewee.nwc.navy.mil
Message-ID: <C7plzt.KqM@avalon.nwc.navy.mil>
Source record: 280964

I understand WHY FCC requires type acceptance. I guess I just
want to know
1. if any extended coverage 440 units are type accepted for GMRS
operation (or why not)
2. what I must do to gain type acceptance for a unit in
my possession that I believe will meet emissions regs.
(or why I can't get there from here...)

Thanks

DEFINITIONS:

Date (day only)
10.7 cm SOLaR radio FLuX forecast
HF Propagation Conditions for LOw, MIddle, HIgh, and POlar areas (see below)
HF Short Wave Fade Probability (in %)
HF Maximum Usable Frequency in +/- percent above seasonal normals.
HF Prediction CONfidence Level (in %)
VHF Sudden Ionospheric ENHancement Probs (in %), weighted for low-mid lats
PROBability of "s"poradic E (Es) during the UT day for low, mid and high lats
VHF AUroral BacKScatteR Probs (in %) for LOw, MIddle and HIgh Latitudes
VHF Overall Global DX Potential (in %) - weighted for Low and Middle latitudes
Geomagnetic Activity Kp Index (peak value - see below)
GeoMAGnetic Activity Ap Index (peak value - see below)
AURORAl Activity for LOw, MIddle and HIgh Latitudes (see below)

HF Prop. Quality rated as: EG=Extremely Good, VG=Very Good, G=Good, F=Fair,
P=Poor, VP=Very Poor, EP=Extremely Poor.
```

Probability of Sporadic E (Es) for the various latitudes is given in percent.
Kp Planetary Index rated: 0=V.Quiet, 1=Quiet, 2=Unstld, 3=Active, 4=V.Active,
5=Minor Storm, 6=Major Storm, 7=Maj-Sev Storm, 8=Severe Storm, 9=V.Severe.
Ap Planetary Index rated: 0-7=Quiet, 8-16=Unstld, 17-29=Active,
30-49=Minor Storm, 50-99=Major Storm, Severe Storm >=100.
Auroral Activity rated: NV=Not Visible, LO=Low, MO=Moderate, HI=High,
VH=Very High.

| Conditions | Given in 8-hour UT intervals | Intensity |
|_____________________________________________________________________________|
```

CONFIDENCE LEVEL: 70%

NOTES:
Predicted geomagnetic activity is based heavily on recurrent
phenomena. Transient energetic solar events cannot be predicted reliably over
periods in excess of several days. Hence, there may be some deviations from
the predictions due to the unpredictable transient solar component.

-------------------------------------------------------------
Chart Start Date: Day #087

NOTES:
This graph is determined by plotting the greater of either the planetary
A-index or the Boulder A-index. Graph lines are labelled according
to the severity of the activity which occurred on each day. The left-
hand column represents the associated A-Index for that day.
Q = Quiet, U = Unsettled, A = Active, M = Minor Storm,
J = Major Storm, and S = Severe Storm.

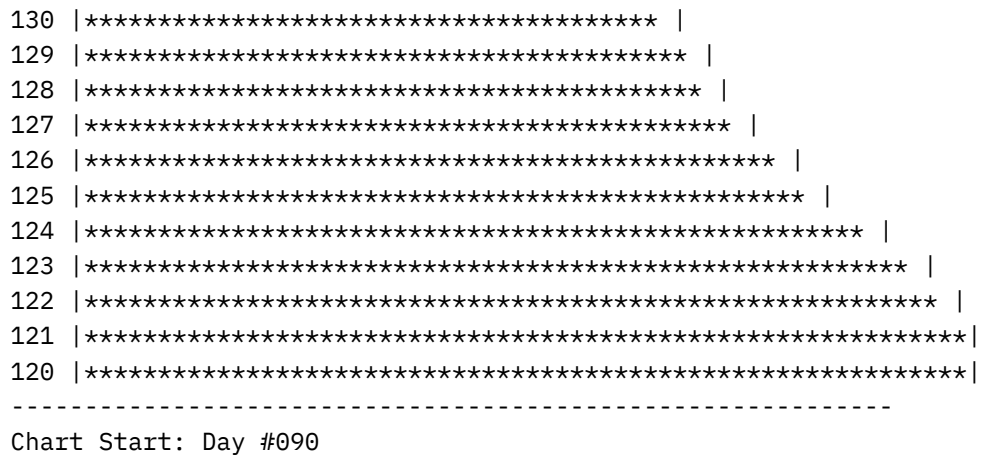
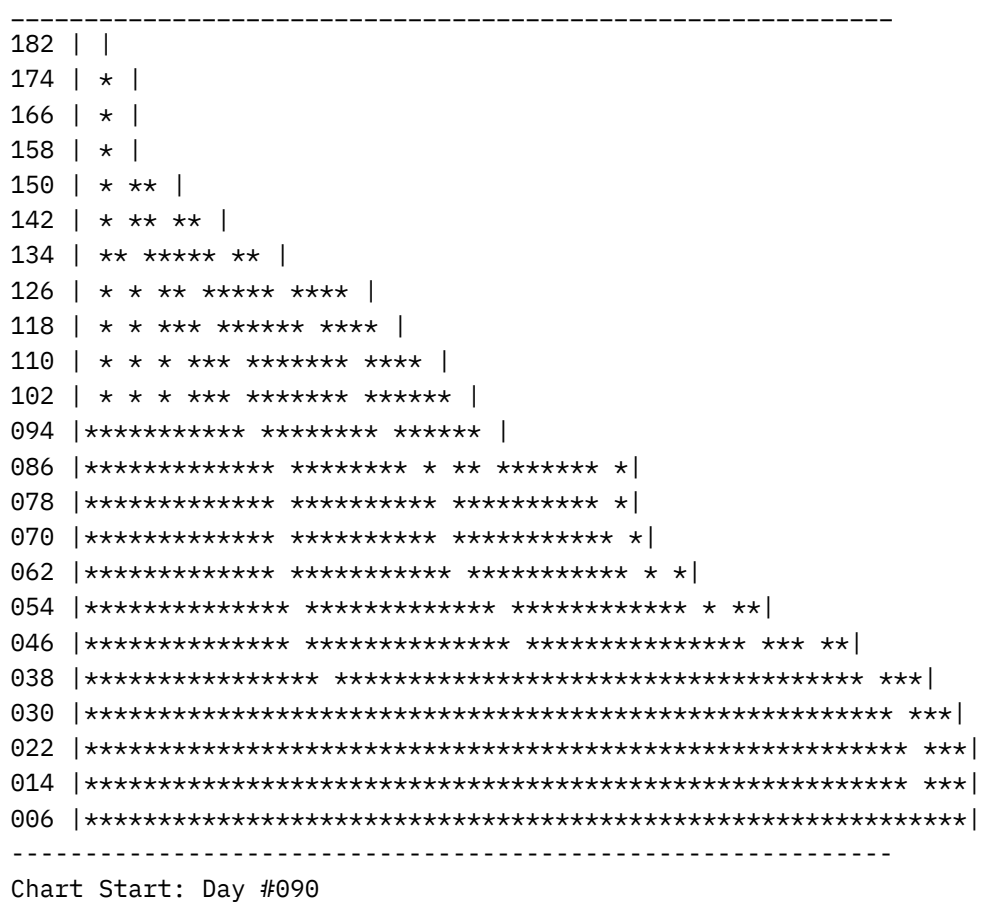
-----------------------------------------------

_____________________________________________________________
134 | |
133 |************* |
132 |***************** |
131 |******************* *********** |
```



NOTES:
The 10.7 cm solar radio flux is plotted from data reported by the Penticton Radio Observatory (formerly the ARO from Ottawa). High solar flux levels denote higher levels of activity and a greater number of sunspot groups on the Sun. The 90-day mean solar flux graph is charted from the 90-day mean of the 10.7 cm solar radio flux.

CUMULATIVE GRAPHICAL CHART OF SUNSPOT NUMBERS



NOTES:
The graphical chart of sunspot numbers is created from the
daily sunspot number counts as reported by the SESC.

Does anyone here know why almost all consumer-grade AM broadcast band radios have used a 455 kHz or thereabouts i.f. frequency, i.e., why did they settle on 455 kHz? This must date back to the 1940s at least.

(One exception I saw was an old car radio with a 262 kHz i.f. And of course good amateur and commercial equipment has used other frequencies.)

Reasons I have heard include a) in the early days the most readily available i.f. transformers used this frequency, b) (related to item a in a chicken vs egg manner) one or two big manufacturers arbitrarily chose this frequency and almost everyone else followed the leader, c) some industry committee made the decision, d) it was believed this had the least potential for stray radiated i.f. signals interfering with other radio services (I have a hard time believing this one), and e) early radios had horrendous image-rejection problems unless the i.f. frequency was this high (I also have a hard time believing this one).

> I could not agree with Gary more. I owned a TS-790A for over a year.
> It was a nice radio, but it was CRAP for satellite work....I have two
> friends with FT-736R and they are really nice radios.

This sounds like a good time for me to trot out some of my dumb OSCAR-chaser wannabe questions....

Okay, I've followed discussions on this topic in the past and gotten the message that the TS-790 isn't very well thought of as a satellite rig. What I have *not* figured out yet is the relative merits of the IC-970 versus the FT-736. It seems to me that the FT-736 is the multiband rig of choice for OSCAR work. Is this because of the ~$1K difference in the price tag, or are there technical reasons that folks seem to prefer the FT-736 over the IC-970?

I'd like to have 2M, 70cm, and 23cm capabilities, so I'm looking at installing the 23cm band module in any multiband rig I might buy. It seems that the alternative would be to buy the two all mode mobile rigs that Yaesu makes (are they called the FT-290/490?) and some up- and/or down-converters to add 23cm. What features would I be sacrificing if I were to take this route? Is mucking around with converter boards a task that someone with precious little electronics construction experience (a.k.a. an "appliance operator" by today's standards of popular vernacular) can tackle without developing and ulcer?

Another factor that's not very well documented in the literature but is important to me is computer control. (I may be an applicance op when it comes to the hardware, but I look forward to hacking the software!) Is there much of a difference in the range of features that can be controlled via the computer interface on the FT-736 and the IC-970? And what about the FT-290/490; is a computer interface even available for these little beasties?

Finally a question about antennas. I understand that I'll probably want to install circularly polarized antennas for OSCAR work, but I'm also interested in terrestrial SSB as well. Since this will be my first experience above 28 MHz using a mode other than FM, and I'm curious how well circularly polarized antennas interoperate with horizontally polarized antennas. Will I get satisfactory performance using a circularly polarized antenna for

terrestrial SSB, or will this require a separate antenna?

Thanks in advance to folks like Gary and Bob and anyone else who responds to this posting. You are the inadvertent Elmers who have contributed significantly to my understanding of these topics as a result of the items you post in this forum....

I recently acquired a Heathkit HW-101, and I was wondering if anybody
knows how to go about calibrating the dial on the tuning knob? Is
there an easy way, or do I need a receiver for this? Next question:
I have a pretty good idea about how to tune the finals, but can abybody
tell me the exact procedure?
Thanx in advance!

Hello everyone

I would like to find information and/or owners manuals
for the Heathkit Model W-5M amplifier.

The following tube numbers are marked on the
cabinet

V1 12AU7
V2 12AU7
V3 KT66 (6L6)
V4 KT66 (6L6)
V5 5R4GY

I would like to use this kit to design an electric guitar
amplifier.

Any Heathkit info would be appreciated.

thank you Mike Gallagher

SB SAREX @ AMSAT $STS-57.001
STS-57 SAREX Mission Delay

I just recieved the following message from Lou McFadin, W5DID, regarding the flight of STS-57. STS-57 is the next in the series of 5 SAREX missions planned for this year. STS-57 will fly 2 meter voice and packet on this flight. The primary objective of this mission is to retrieve the European Eureca satellite.

Message from W5DID:

It has just been announced that STS-57 launch will be delayed until the week of 14-18 June. This delay is due to problems with the pump on the Shuttle main engine. Further details will be sent as available.

Since I'm about to move into a house here on a 1/5 acre lot
I've been pondering the 1/2 wave verticals now on the market
as a quick and easy way to get on several bands (ie. till the
tower goes up.)

A friend back in 1-land was very happy with his GAP vertical
when he faced a similar situation. The spec's sound wild, (80
thru 2 meters) but really 40, 20 and 15 are my main interest.

Any hands on experience with it vs. more traditional verticals
like the R5/R7 or the Butternut?

...and no need to start a session on the bad aspects of verticals
or multiband antennas etc. I used to have a few acres and lots
of big trees for all sorts of wire antenna but those days are gone
and besides the weather is much nicer here!

I have a 100 watt Weller soldering iron that I've lent to co-workers.
I've gotten a number of comments that it works great for soldering pieces
of metal like connectors. With its large tip, it has a lot of thermal
mass. I've used it to solder WR-90 waveguide (0.5 x 1 inch rectangular
pipe, about 50 mils thick, if I remember right) :-). Of course, this
is indoors--I don't think it could solder waveguide outside in a New
England winter wind storm. The only complaint is the temperature control
mechanism, which I've discovered is not immune to the abuse that occurs
when you lend stuff...

I don't have the FAR Book handy here, but I've read the FAR
regarding the use of radios/transmitters on board aircraft. If I recall
correcly, it is up to the PIC (Pilot in Command) that decides if you
can use your radio in flight.
A few months ago, I was listening to a local repeater and
heard an aeronautical mobile... One of the hams on the ground asked if
he obtained permission of the pilot to use his radio... The response was
that he was the pilot! If a hand-held 2m is going to cause interference
on an aircraft, you would think the cockpit would be good test.

3249. Info needed on some military receivers (REPOST)

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-28 03:36:18 UTC
From: keith@radio.nl.nuwc.navy.mil
Message-ID: <1072@radio.nl.nuwc.navy.mil>
Source record: 280855

I posted this and I don't think it ever showed up. Let's try again...

I'm familiar with the typical R390's, R388's and receivers of that class
that show up from time to time, but I've run across some receivers that
I could use some info on:

R1279D (covers 30-300MHz) <-- I may have these first 2 reversed
R1401A/G (covers 1-600kHz)
CV1750/U (frequency converter - appears to cover 225-1000MHz)

Does anybody have any info on/experience with these? They appear to be well
built, perhaps 70's vintage? What do they usually sell for?

Thanks in advance,
Keith Kanoun, WA2Q

Dear Dave (KN6BX)

Congratulations on your new home! I'm an apartment dweller myself, and am nudging my wife to move out into the countryside.

I don't have any experience with the GAP vertical you mention (I don't even know what it is). I have used a Butternut HF6VX, though, and I've talked with various R5/R7 owners.

There are three considerations here: cost, space, and ease of use. If radials are no problem for you, consider the HF6VX, or the AP80. These are cheaper and allow operation with wider bandwidth on the lower bands. Unfortunately, I know first-hand that the HF6VX is tricky to tune properly, especially if you don't have enough radials. If you enjoy trouble-shooting multiband antennas and you don't mind laying radials, then by all means consider an HF6VX or similar antenna. It's really nice to have a multiband vertical with low-band capability. No need to switch antennas when you change bands -- even better if you have an automatic antenna tuner. When your tower comes, you can compare your beam with your vertical, or you can use your vertical to spot DX and then swing your beam over. I would definitely keep the vertical after you get your tower and beam.

The R5/R7 verticals are much easier to set up. More expensive, though. Since they don't use radials, they're prime candiates for top-of-the-rotor-mast installations once you get your tower. If I had the money, I'd buy an R7, plant it on the ground or the roof for the time being, and when the tower comes, put it on the very top.

The 5763 VHF Beam Power Tube
-- This data all came from the RCA Receiving Tube Manual,
copyright 1973, Gee, I sure hope they haven't changed everything
since then.... ;^)

This miniature type VHF beam power amplifier was designed for use in low
power stages. The minature 9-pin socket is wired in "9K" configuration (see
outline section "6E")

Heater voltage: 6.0v +/- 10%
Heater current: 0.75a
Heater-Cathode voltage: +/- 100v max
Transconductance for plate current of 45 ma: 7000 umhos
Mu-factor Grid 2 to Grid 1 : 16
Direct electrode capacitances:
-- Grid 1 to Plate: 0.3 pf
-- Input: 9.5pf
-- Output:4.5 pf

----------8><----------

> I need in particular of basic data same (Va, Vg2, Vg1, Vf , S , ecc.).
Now, you ask for Vg, etc, but those values are very much dependent
upon your application! Class A versus Class C AM modulated versus
Telephony...If you tell me more of what you want this tube to do, and
how it behaves, I'd be happy to fill in a few of the blanks...

> Thanks in advance.
No problem. Hope I can help..

3253. Softball team fundraiser gets 8K FCC fine

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-28 04:45:51 UTC
From: wa2ise@netcom.com
Message-ID: <wa2iseC7pzwF.AzM@netcom.com>
Source record: 280956

Heard on the _Howard Stern radio show_ a news item about a softball team getting fined by the FCC. According to Howard and Robin (the radio talk show hosts) the news item said that the team held a fundraiser in the Norfolk, VA area. They had set up a radar gun tp measure the velocity of pitched baseballs, and fundraiser attendees paid to see how fast they could throw. Turns out someone from the FCC happened to go to the fundraiser and, noticing the radar gun, asked about a license for it. No license. Oops. $8000 fine.

3254. Does Anyone know of a wefax server ?? (6Y5KW)

No.

> 2) Is there an easy way to tell when the connector is hot enough before
> the insulation starts to "flow"

Wrap a single turn of 1/32" solder around the connector near the holes
next to the threads.

> 3) I had someone tell me that I shouldn't attempt to flow solder in all
> the solder holes on the connector for the shielding. Is there a minimum
> number that must be soldered.

If you're using an iron that is too small, this is correct. Otherwise
solder the braid all the way around.

Included is an article that I wrote concerning SO-239 UHF type connectors.

Subject: How to solder PL-259 and SO-239 connectors

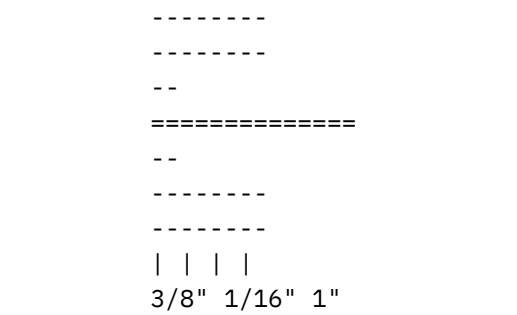
How to solder PL-259 (UHF) connectors and get them hot enough to work
right without melting the inner insulator. If you're doing the SO-239 (female)
connectors, refer to steps 3 and 8. Use the soldering gun without the tips,
and a good grade of rosin flux. Use a Weller soldering gun, 120 watt version.
Use a decent grade of solder. 40/60 is fine, 37/63 is even better.

Additional tips. Use the yellow phenolic (or teflon) insert, with the
silver plated parts manufactured by Amphenol (or Kings and others). They are
easy to solder, but most importantly, they are correctly dimensioned. Use a
good grade of coax, American made with an RG or in house number. Likewise, it
is correctly dimensioned. Use that sticky black tape, "coax-seal" to cover the
connector(s) if they are used outside. (Or in the shower inside).

Finally, don't be a cheap ba**ard. Use NEW coax. Use NEW connectors.
Use quality parts (see above) that couple of dollars you save is not worth the
aggravation of climbing a tower and replacing a 100 feet of coax. Or the final
section of your radio/amplifier.

1. Put the connector barrel on the cable

2. Prepare coax. strip jacket, shield, center conductor. Make sure that the braid is smooth and no stray ends are splayed out.



3. Use rosin based past flux, (not the zinc chloride "no-corrode" stuff) and coat the braid and center conductor.

4. Pre-tin the braid and center conductor. Hint, once the braid is tinned, whack the cable end against the bench while the solder is still "wet".

5. Clean all the flux off of the center conductor and braid with solvent type flux remover.

6. Make sure the connector barrel is on the cable and facing the right direction.

7. Thread the connector body onto the cable jacket until the die-electric bottoms out inside the connector. The braid should fully cover all four soldering holes.

8. Check that connector barrel one more time. This is your last chance!

9. Solder the center conductor to the center pin make sure you have enough solder to fill the pin. Do not use an excessive amount or you can short the connector assembly.

10. Remove the tip from the soldering gun. Place the two stubs against the side of the connector body. (straddling the shield soldering holes.) Heat the connector body and flow solder into the shield. Rotate the body and do the opposite side, then the adjacent sides. (Having someone help makes this easier)

11. Wipe excess flux off of connector, and clean it with solvent type flux remover. If you find the connector barrel laying on the bench top now, cut the connector off of the cable and throw it away. You'll remember it the next time.

12. Check cable for shorts and continuity.

Wonderful things semi-conductor junctions. They make great X-ray detectors.
Typically what happens is that all the junctions fire like an SCR when they
get hit with X-rays. Since most Handhelds have a lithium battery keeping the
memory chips turned on, there are all sorts of interesting effects when the
memory chips start having some or all of thier junctions fireing randomly.

Am I correct in concluding that there was a time in which amateur
radio was highly technical and there were a lot of moderately
theoretical books published for amateurs? Perhaps in the UK, but
judging from our library, I don't think so.

/>About the best that amateur radio can offer is the ARRL's "Solid State
>Design for the radio Amateur" which too is ageing, and lacks much theory
>and any maths, but is a good entry into RF matters with good
>explanations. One of the Authors was a senior RF designer at Tektronix
>at the time.

What it really depends on is at least one individual with the appropriate
knowledge actually writing a book. Once written, its an extremely steep
path downhill. It seems a bit flawed to judge the state of amateur
radio by such an infrequent occurance. How many great books came out of
the "Golden Era" when amateur radio really was technical? And when was it?

An interesting book that I've been reading is

Microwave Circuit Design
Using Linear and Nonlinear Techniques

by Vendelin, Pavio, and Rohde. John Wiley & Sons, 1990.

Its probably a bit much for most amateurs, but not everyone.

It is my personal opinion that the IC-970 suffers from many of the `features' that made the TS790A unusable for satellites. The inability to select easily who was transmitter and who was receiver, and other human-interface problems. It is a beautiful radio but it definitely is NOT worth the extra money in my personal opinion. Right now, right this minute, the Yaesu radio, FT-736R, contains the features you want in a satellite radio, with a few exceptions. The receiver and transmitter frequencies, modes, etc. can be controlled via the computer interface. Many of us use the Kansas City Tracker/Tuner board. This is a PC clone board, takes up a slot, and software (TSR's) to do a lot of the work. The things you lose are the convenience of having seperates. I do NOT believe that 290/490 have computer control but I will be happy to be corrected by those in the know.

>it's efficiency won't be as good on those bands, but it'd even suffice
>for local contacts on 75.

You are right, it doesn't work all that well on 75 meters. DX for me
with 2 watts is something in the Caribbean--don't think I've even worked
a A on 75 meters. However, it seems to do OK for running checking into
80M QRP nets as far away as Michigan. Actually, the problem band is
15 meters, but I just load up a vertical hanging off a tree outside
my apartment, rather than trying to make one antenna do *everything*.

One of my favorite recommendations is a *single* band dipole (40/80 meters
for night time operating, 20 or 15 meters for daytime operation). Its
simple, doesn't require a tuner, and lets the beginner get on the
air quickly. The fancy setup can come later. Ideally, the dipole can
be used as a comparison if a new antenna seems flawed, keeping in mind
that a large number of signals have to be compared to really see which
is working better.

Interestingly, with a customized tuner its not that hard to load up
either an 86 or 66 foot wire on 160 meters to make QRP CW contacts out
to about 500 miles, though 2 way QRP CW contacts are pretty tough
unless you have someone like W3TS on the other end.

>>Also, if the feedline is balanced and I'm using a balanced tuner, does the
>>feedline length really matter, as some seem to think? Or does it only
>>matter if the feed or match is unbalanced.
>
>Yes it can matter. While the line is *balanced*, it's not *matched*

>and will have a relatively high SWR. Now that's not a problem from
>the loss standpoint, but a transmission line with an SWR other than
>1:1 acts as a transmission line *transformer* and will change the
>impedance seen by the tuner. Tuners don't have infinite matching
>range, and different feedline lengths can present impedances that
>are sufficiently different to make the difference between go and

>
>>By the way, my tuner's schematic (AEA Econotuner) shows a center-tap-
>>grounded inductor with the balanced feedline across the whole thing and the
>>single-ended connection to the rest of the tuner and rig connected to one
>>end.

I put the balun between the tuner and the rig. Thus, once the system
is tuned up, the balun sees its design impedance, and not something off
the wall. I cheat by running QRP, so I can use a toroidal inductor that
doesn't couple much to ground, allowing an unbalanced network to be used
without upsetting the balance of the system appreciably. High powered
operation can be a bit much for iron powder toroids, necessitating air
core inductors with large fields that couple to ground much more. I did
build a balanced tuner, but the ganged controls felt awful. It was
scrapped and the box used for a 40 M transceiver.

3264. Re: Why 455 kHz?

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-28 10:23:29 UTC
From: WOLF KOEHLER <WKOEHLER@ESOC.BITNET>
Message-ID: <93148.102329WKOEHLER@ESOC.BITNET>
Source record: 280965

In Germany, way back until perhaps 20 years ago, it used to be 467 kHz.
Then, with the markets becoming more international, they changed it
to 455 kHz. The only reason I know is that these frequencies are placed
conveniently between the long wave and the medium wave bands and are
not being used as other services (remember the frequency range between
415 and 510 kHz is allocated to the maritime service, CW only, with fixed
frequency allocations within the band).
Conveniently placed in this context means convenient for building
a superheterodyne receiver for LW and MW reception.

>

THIS IS INCORRECT. No VEC, INCLUDING ARRL, charges for NOVICE exams. If they do, it is ILLEGAL and probably the error is on the VE, NOT the VEC (ie, ARRL). If a person takes and fails the Novice written or the 5 wpm code test, their money (if they had given any) must be refunded. They can retake the test, at the discretion of the VE, for the same price, ie NOTHING.

On the other hand, once the person takes the Technician test, and passes (oh, and by the way, he does have to pay a fee for the Technician test, according to the different rules of the different VECs), then the person is considered to be under the Technician rules. If he later takes the 5 wpm code test, the standard fees apply, since this is no longer a Novice test.

Don't blame the ARRL for a mistake by a VE.

OSCAR antennas will work fine for terrestial work, but remember that you'll
take a 3 dB hit in signal strength when working either a horizontally or
vertically polarized station. Other than the 3 dB loss, things should work
out fine. I've been using my OSCAR antennas on an 8' tripod in my backyard
while I duke it out with the village and neighbors over getting my
terrestial antennas back up.

And welcome to some great bands/mode. 2 m and 70 cm sideband are my
favorite places to operate.

73,
Todd

Boy, if this is true then I *really* wonder about the Yaesu and
Alinco radios...

I have a TH-78A, and yes, it is *terrible* for picking up interference
like this. It particularly frustrates me because I cannot use my
radio at home with any sort of external antenna, because I end up
listening to a continuous drone of paging systems and repeaters.
This condition is not helped by the fact that my house is on a ridge
which is popular for commercial services to put antennas on - but
I still don't have this problem with any single-band radios.

When I bought a multi-band mobile unit for my car, I made a point of
getting a unit with separate receive stages for the different bands
(rather than the very wide-range receivers like in the HT's), on the
premise that the separate receivers probably had better front-end
receive characteristics and hence less interference problems.
Fortunately this seems to have paid off. I gave up the ability to
listen to two frequencies on the same band, but the freedom from
all that noise has been worth it. [Anyone care to comment on
how good various mobile units are with respect to this problem,
especially in comparison to the HT's?].

3272. Need for Radar Gun License RE: FCC Softball Fine

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-28 13:30:34 UTC
From: RON@NSULA.EDU
Message-ID: <930528083034.10d46@NSULA.EDU>
Source record: 280830

The message posted yesterday about the FCC levying the fine on the softball fundraiser for using an unlicensed Radar Gun to Clock the pitchers reminded me of a question I once had.

As a former Police Officer I can remember asking the powers that be in the department about the licenses for the Radar equipment. Each time the answer was that they had been told the License for the VHF/UHF radios in the car would cover it. I repeatedly told them that this was not the way it worked, but of course who was I to know how it should or should not work.

I have always understood that the unit must be licensed, the license or a copy must be affixed to the unit in a visible location, and must be recertified and calibrated each year.

If anyone has any specifics on this and how the guns are covered I would be interested in hearing about it. Even more so, interested in letting the old department know how it really works. Any narratives or specific incidents would really be of help. They've been lucky so far. No one has challenged them in court as to whether or not the unit was licensed, had received it yearly recalibration, or if it's operators had been certified to use it.

3273. Re: IC 271/471 vs IC 275/475 Performance Question

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-28 13:50:26 UTC
From: gary@ke4zv.uucp
Message-ID: <1993May28.135026.3953@ke4zv.uucp>
Source record: 280851

In article <seeler.17.738498832@UPEI.CA> seeler@UPEI.CA (David Seeler) writes:
>Just a quick note to ask your opinion about the performance of the IC 271/471
>radio pair versus the more recent models - the IC 275 and IC 475. My interest
>relates to the fact that there are published mods for the 271 and 471 for use
>with 9.6 Kb packet. The 275 and 475 have received good reviews in the past
>for general as well as satellite operations.
>
>Can the same be said of the earlier pair?

The progression goes 211, 251, 271, 275. The 211 is first generation,
and with a Mutek frontend board swap, is a good satellite rig. It is
based on the 700-720 HF rig chassis. The 251 is a modified 211 with
less desirable characteristics. However, with the Mutek board it's also
a servicable satellite rig. The 271 is a different design, based on the
chassis of the 751, that was short lived on the market. I don't think
an upgrade package was available for it. The 275 is a major new design
that's fully competitive as a first class satellite rig as it comes out
of the box. The same comments apply to the 4xx series except there wasn't
a 411.

The 271 is a different radio than either the ones before or after.
And it didn't last long on the market, so there aren't a lot of
them out there for comparison testing. The 275 is a major step forward
from any of the earlier radios. The receiver is really good. The older
radios needed aftermarket replacement front ends to be competitive.
If money weren't an issue, I'd definitely go with the new radios.
If money were an issue, I'd look for the old stuff and add the Mutek
board. I think I'd pass on the 271 since it's somewhat of an orphan.
It's not a *bad* radio, but it's not that great either, and there
isn't an easy upgrade path.

Gary

3274. Re: Balanced feedline (was: G5RV)

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-28 14:35:13 UTC
From: gary@ke4zv.uucp
Message-ID: <1993May28.143513.4102@ke4zv.uucp>
Source record: 280852

In article <1993May27.182537.22611@news.mentorg.com> mbutts@mbutts.mentorg.com (Mike Butts) writes:
>
>My question is how long to make the flattop. Zack Lau at ARRL says 86 feet
>is a 'magic' length good for 20 meters. Gary Coffman says 105 feet is
>a 'classic' length for a center-fed flattop. Why? I don't see the
>wavelength relationships for either.

And that's the point. If the antenna presented a resonant length on one band, it would present a resonance at a multiple on higher bands, and that would give a very high feedpoint impedance that's hard to match. By picking a length that's not harmonically related to the bands, the tuner will see an impedance more in line with it's available matching range. 105 feet works well for 75 meters and above. If you don't need 75, then the 86 foot length should work at 40 and above. It will be a little hard to feed on 75 meters, and a bit tricky to match on 40, and it's efficiency won't be as good on those bands, but it'd even suffice for local contacts on 75.

>Also, if the feedline is balanced and I'm using a balanced tuner, does the
>feedline length really matter, as some seem to think? Or does it only
>matter if the feed or match is unbalanced.

Yes it can matter. While the line is *balanced*, it's not *matched* and will have a relatively high SWR. Now that's not a problem from the loss standpoint, but a transmission line with an SWR other than 1:1 acts as a transmission line *transformer* and will change the impedance seen by the tuner. Tuners don't have infinite matching range, and different feedline lengths can present impedances that are sufficiently different to make the difference between go and no go with a particular tuner.

>By the way, my tuner's schematic (AEA Econotuner) shows a center-tap-
>grounded inductor with the balanced feedline across the whole thing and the
>single-ended connection to the rest of the tuner and rig connected to one
>end.

Gack! I expect this tuner will present some interesting problems. It's just a 4:1 voltage balun hung off of an L network. It probably won't have enough range to deal with the complex impedances presented by the "universal" zepp. A link coupler with a split stator capacitor and symetrical tapped inductor would be better. An S-P network might be good if you can't stand tapped inductors.

```
Archive-name: radio/ham-radio/hams-on-usenet/part1
Last-modified: $Date: 93/05/28 07 34$
Version: $Revision: 1.01 $

I would be pleased to take any e-mail updates to this list, preferably at
hams-on-usenet@ve6mgs.ampr.ab.ca. I have split this list into four parts. This
First part contains primarily European calls with US call districts 0 and 1.
The index of parts:
Part 1 contains 4x1pi through k1zz
Part 2 contains n2aam through kc4zwi
Part 3 contains kj5aa through n7zzd
Part 4 contains wv8a through zl4rae

Ciao, 73 de VE6MGS/Mark -sk-

#
# This document may be distributed freely, as long as there is no financial
# gain. I do not condone this list being used for generating junk mail or
# other annoyances as this is not the purpose of the list. If you are in this
# list and wish to keep your entry hidden, or that the name I have here be
# changed (My middle name is Gregory and I am **** proud of it :-), I would
# oblige.
#
```

Entries have this format (-> denotes separated by at least one tab):
Address (Name) -> Call -> Date
#
Address
Network address popularily used by individuals on the network. Although
the address that many news posters add may be incorrect, personal
e-mail contacts or updates are always placed first in the list of
duplicate calls. Removal of entries is by complaint only, so some
(mainly .EDU) may be invalid over time. Some GENIE Hams are included
(Generated by Brian Murrey/KB9BVN) in this list, their addresses are
listed as ??@<GEnie> which of course is unaddressable. Mike Shirley
WB6WUI mikey@slic.cts.com is willing to relay manually to GENIE.
<user>@genie.geis.com may be used from the Internet, but this is an
optional extra cost service to the GEnie user and may, or may not work.
For addresses like #:#/#.#@<Fido>, try <name>@p#.f#.n#.z#.FidoNet.Org.
Name Name of the individual.
Call Call letters of the individual. Old and alternate calls '/' separated.
Date Last update YY-MM[-DD] International format.
A trailing * denotes not searched in call book for verification yet, @
means not found in call book (1987 or 1992 US). ? after means recheck may be
required (eg. Call does not match name).

3276. Radio Amateurs on USENET List May 1993 Part 2 of 4

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-28 14:39:11 UTC
From: mark@ve6mgs.ampr.ab.ca
Message-ID: <1993May28.2@ve6mgs.ampr.org>
Source record: 280833
Cross-posted to: rec.radio.amateur.misc,rec.radio.info,rec.answers,news.answers

```
Archive-name: radio/ham-radio/hams-on-usenet/part2
Last-modified: $Date: 93/05/28 07 38$
Version: $Revision: 1.01 $

I would be pleased to take any e-mail updates to this list, preferably at
hams-on-usenet@ve6mgs.ampr.ab.ca. I have split this list into four parts. This
Second part contains primarily US call districts 2, 3 and 4.

Ciao, 73 de VE6MGS/Mark -sk-

# Network address to name or call letters lookup table maintained by
# Mark Salyzyn VE6MGS mark@ve6mgs.ampr.org
#
# Please send corrections/deletions/additions hams-on-usenet@ve6mgs.ampr.ab.ca
# (if unreachable, mark@ve6mgs.ampr.org or adec23.UUCP!mark is ok)
#
# archived for ftp @ ftp.cs.buffalo.edu:hams_on_usenet courtesy of
# Devon Bowen KA2NRC bowen@cs.buffalo.edu
# also ftp @ grivel.une.edu.au:pub/ham-radio/aus.radio/lists/internet.hams
# courtesy of Dean Davidson <ddavidso@metz.une.edu.au> for Australian hams.
# Canadian call lookups courtesy of the work of VE3RD packet callbook server
# installed on the VE6MC.#edm.ab.can.noam FBB BBS.
# US call lookups courtesy of the callbook@sat.datapoint.com email server.
# email `grep' server reqnet@ve6mgs.ampr.ab.ca in the body of the message put
# a `lookup string ...'. email response limited to 10K. if you want to specify
# a return address, add `return user@host.domain'. For example:
# Subject: Could be anything (sure!)
# return wabbit@it.was.a.tewibble.storm.edu
# lookup ka2nrc ve6tcp nm1d elmer
#
# Last update May 28 1993
#
# This document may be distributed freely, as long as there is no financial
# gain. I do not condone this list being used for generating junk mail or
# other annoyances as this is not the purpose of the list. If you are in this
# list and wish to keep your entry hidden, or that the name I have here be
# changed (My middle name is Gregory and I am **** proud of it :-), I would
# oblige.
#
# Entries have this format (-> denotes separated by at least one tab):
# Address (Name) -> Call -> Date
#
# Address
# Network address popularily used by individuals on the network. Although
```

the address that many news posters add may be incorrect, personal
e-mail contacts or updates are always placed first in the list of
duplicate calls. Removal of entries is by complaint only, so some
(mainly .EDU) may be invalid over time. Some GENIE Hams are included
(Generated by Brian Murrey/KB9BVN) in this list, their addresses are
listed as ??@<GEnie> which of course is unaddressable. Mike Shirley
WB6WUI mikey@slic.cts.com is willing to relay manually to GENIE.
<user>@genie.geis.com may be used from the Internet, but this is an
optional extra cost service to the GEnie user and may, or may not work.
For addresses like #:#/#.#@<Fido>, try <name>@p#.f#.n#.z#.FidoNet.Org.
Name Name of the individual.
Call Call letters of the individual. Old and alternate calls '/' separated.
Date Last update YY-MM[-DD] International format.
A trailing * denotes not searched in call book for verification yet, @
means not found in call book (1987 or 1992 US). ? after means recheck may be
required (eg. Call does not match name).

3277. Re: RSGB books info

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-28 14:40:31 UTC
From: dstock@hpqmoca.sqf.hp.com
Message-ID: <C7qrFK.194@hpqmoea.sqf.hp.com>
Source record: 280837

RSGB Book sales at their haedquarters:

RSGB Sales
Lambda house
Cranborne Road
Potters Bar
Herts
EN6 3JE

Phone +44 707 659015 usual credit cards etc.

They stock and sell ARRL publications, but check ARRL prices first.

I feel that many of the RSGB books are showing their age and are overdue for major revision. I know of none with any moderate level theoretical coverage. Maybe amateur radio is really becoming less technical, and this is the publishing industry tracking this change. About the best that amateur radio can offer is the ARRL's "Solid State Design for the radio Amateur" which too is ageing, and lacks much theory and any maths, but is a good entry into RF matters with good explanations. One of the Authors was a senior RF designer at Tektronix at the time.

Horowitz and Hill "The Art of electronics" is the standard entry into non-RF electronic hardware and is well written with excellent explanations. The authorss are instrumentation specialists and this shows in the book. I recommend it strongly. Not deep theoretically, it's still a good starting point and a guide to where to dig deeper.

Historically, measurement and RF design have been minority interests, overshadowed by microprocessors, etc. and have not been taught much. Most of the knowledge resides with people who learned by experience and so little is easily found in print.

Hewlett Packard has published a Journal (Hewlett-Packard Journal) since almost when it was founded, in here are the explanations and theory behind many of the standard measuring instruments, oscilloscopes, spectrum analysers, network analysers along with some information on the people who developed them. Today it has more of a computer/software/printer content, so you need to find a library with an extensive collection. (There is also a set of applications notes covering a matching span of years.) These are more likely to be found in company libraries than public libraries.

Other companies (Tektronix, Rohde u Schwarz etc.) have similar publications.

Trade magazines (RF Design, Microwaves and RF etc) are the main carriers of new technology, books lag behind.

Hope this helps (the criticisms are just my personal opinions)

David GM4ZNX

3278. Re: GAP vs. R7 etc.

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-28 14:42:04 UTC
From: maessm@rs6320.ecs.rpi.edu
Message-ID: <1u58bs$qjh@usenet.rpi.edu>
Source record: 280869

As far as the GAP vs. Butternut HF6V, I would recommend the GAP over the Butternut. I have used both antennas. The GAP comes pre-tuned, with an SWR of less than 2:1 in the 40-10 meter ham bands, and has about 130-150 kHz bandwith on 80 meters. The Butternut can be a witch to tune, and you're lucky to get 50 kHz of bandwith on 80 meters. The GAP only requires three 25-foot radials, while the butternut, in order to operate efficiently, requires a substantial ground system. The GAP also appears to be more ruggedly put together, and the SWR of the antenna is almost unchanged when it bends in the wind. I recommend nylon guy lines for both antennas if they are goign to be subject to high winds or up for a long time.

Last-modified: $Date: 93/05/28 07 41$
Version: $Revision: 1.01 $

I would be pleased to take any e-mail updates to this list, preferably at
hams-on-usenet@ve6mgs.ampr.ab.ca. I have split this list into four parts. This
Third part contains primarily US call districts 5, 6 and 7.

Ciao, 73 de VE6MGS/Mark -sk-

# Network address to name or call letters lookup table maintained by
# Mark Salyzyn VE6MGS mark@ve6mgs.ampr.org
#
# Please send corrections/deletions/additions hams-on-usenet@ve6mgs.ampr.ab.ca
# (if unreachable, mark@ve6mgs.ampr.org or adec23.UUCP!mark is ok)
#
# archived for ftp @ ftp.cs.buffalo.edu:hams_on_usenet courtesy of
# Devon Bowen KA2NRC bowen@cs.buffalo.edu
# also ftp @ grivel.une.edu.au:pub/ham-radio/aus.radio/lists/internet.hams
# courtesy of Dean Davidson <ddavidso@metz.une.edu.au> for Australian hams.
# Canadian call lookups courtesy of the work of VE3RD packet callbook server
# installed on the VE6MC.#edm.ab.can.noam FBB BBS.
# US call lookups courtesy of the callbook@sat.datapoint.com email server.
# email `grep' server reqnet@ve6mgs.ampr.ab.ca in the body of the message put
# a `lookup string ...'. email response limited to 10K. if you want to specify
# a return address, add `return user@host.domain'. For example:
# Subject: Could be anything (sure!)
# return wabbit@it.was.a.tewibble.storm.edu
# lookup ka2nrc ve6tcp nm1d elmer
#
# Last update May 28 1993
#
# This document may be distributed freely, as long as there is no financial
# gain. I do not condone this list being used for generating junk mail or
# other annoyances as this is not the purpose of the list. If you are in this
# list and wish to keep your entry hidden, or that the name I have here be
# changed (My middle name is Gregory and I am **** proud of it :-), I would
# oblige.
#
# Entries have this format (-> denotes separated by at least one tab):
# Address (Name) -> Call -> Date
#
# Address
# Network address popularily used by individuals on the network. Although
```

the address that many news posters add may be incorrect, personal
e-mail contacts or updates are always placed first in the list of
duplicate calls. Removal of entries is by complaint only, so some
(mainly .EDU) may be invalid over time. Some GENIE Hams are included
(Generated by Brian Murrey/KB9BVN) in this list, their addresses are
listed as ??@<GEnie> which of course is unaddressable. Mike Shirley
WB6WUI mikey@slic.cts.com is willing to relay manually to GENIE.
<user>@genie.geis.com may be used from the Internet, but this is an
optional extra cost service to the GEnie user and may, or may not work.
For addresses like #:#/#.#@<Fido>, try <name>@p#.f#.n#.z#.FidoNet.Org.
Name Name of the individual.
Call Call letters of the individual. Old and alternate calls '/' separated.
Date Last update YY-MM[-DD] International format.
A trailing * denotes not searched in call book for verification yet, @
means not found in call book (1987 or 1992 US). ? after means recheck may be
required (eg. Call does not match name).

3280. Re: ft530 rubber resistor: tuned low?

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-28 14:46:01 UTC
From: shz@mare.att.com
Message-ID: <C7qrot.8EF@cbnewsm.cb.att.com>
Source record: 280874

In article <C7ooJL.38t@ve3ppe.isis.org>, znha@ve3ppe.isis.org (Gordon Dey) writes:
> Looks like yes, virginia, the
> (or my) system is tuned low, and the antenna has to be a rotten performer!

Yaesu has stopped shipping the FT530 with the rubber dummy load. Their
customer service department will send FT530 owners an FT470 antenna free
of charge if they send in a copy of their purchase invoice and call sign.

I got mine and it makes a world of difference. Contact Yaesu for details.

Seth Zirin, N2UCQ

3281. Radio Amateurs on USENET List May 1993 Part 4 of 4

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-28 14:46:30 UTC
From: mark@ve6mgs.ampr.ab.ca
Message-ID: <1993May28.4@ve6mgs.ampr.org>
Source record: 280836
Cross-posted to: rec.radio.amateur.misc,rec.radio.info,rec.answers,news.answers

```
Archive-name: radio/ham-radio/hams-on-usenet/part4
Last-modified: $Date: 93/05/28 07 45$
Version: $Revision: 1.01 $

I would be pleased to take any e-mail updates to this list, preferably at
hams-on-usenet@ve6mgs.ampr.ab.ca. I have split this list into four parts. This
Fourth part contains whatever is left over ... US call districts 8, 9,
Canadian, and spots left here and there over the globe

Ciao, 73 de VE6MGS/Mark -sk-

# Network address to name or call letters lookup table maintained by
# Mark Salyzyn VE6MGS mark@ve6mgs.ampr.org
#
# Please send corrections/deletions/additions hams-on-usenet@ve6mgs.ampr.ab.ca
# (if unreachable, mark@ve6mgs.ampr.org or adec23.UUCP!mark is ok)
#
# archived for ftp @ ftp.cs.buffalo.edu:hams_on_usenet courtesy of
# Devon Bowen KA2NRC bowen@cs.buffalo.edu
# also ftp @ grivel.une.edu.au:pub/ham-radio/aus.radio/lists/internet.hams
# courtesy of Dean Davidson <ddavidso@metz.une.edu.au> for Australian hams.
# Canadian call lookups courtesy of the work of VE3RD packet callbook server
# installed on the VE6MC.#edm.ab.can.noam FBB BBS.
# US call lookups courtesy of the callbook@sat.datapoint.com email server.
# email `grep' server reqnet@ve6mgs.ampr.ab.ca in the body of the message put
# a `lookup string ...'. email response limited to 10K. if you want to specify
# a return address, add `return user@host.domain'. For example:
# Subject: Could be anything (sure!)
# return wabbit@it.was.a.tewibble.storm.edu
# lookup ka2nrc ve6tcp nm1d elmer
#
# Last update May 28 1993
#
# This document may be distributed freely, as long as there is no financial
# gain. I do not condone this list being used for generating junk mail or
# other annoyances as this is not the purpose of the list. If you are in this
# list and wish to keep your entry hidden, or that the name I have here be
# changed (My middle name is Gregory and I am **** proud of it :-), I would
# oblige.
#
# Entries have this format (-> denotes separated by at least one tab):
# Address (Name) -> Call -> Date
#
# Address
```

Network address popularily used by individuals on the network. Although
the address that many news posters add may be incorrect, personal
e-mail contacts or updates are always placed first in the list of
duplicate calls. Removal of entries is by complaint only, so some
(mainly .EDU) may be invalid over time. Some GENIE Hams are included
(Generated by Brian Murrey/KB9BVN) in this list, their addresses are
listed as ??@<GEnie> which of course is unaddressable. Mike Shirley
WB6WUI mikey@slic.cts.com is willing to relay manually to GENIE.
<user>@genie.geis.com may be used from the Internet, but this is an
optional extra cost service to the GEnie user and may, or may not work.
For addresses like #:#/#.#@<Fido>, try <name>@p#.f#.n#.z#.FidoNet.Org.
Name Name of the individual.
Call Call letters of the individual. Old and alternate calls '/' separated.
Date Last update YY-MM[-DD] International format.
A trailing * denotes not searched in call book for verification yet, @
means not found in call book (1987 or 1992 US). ? after means recheck may be
required (eg. Call does not match name).

3282. Re: Intermod/spurious sigs a common HT problem?

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-28 14:55:26 UTC
From: rph@sq.sq.com
Message-ID: <1993May28.145526.2980@sq.sq.com>
Source record: 280847

You can make most any wide-as-a-barn-door HT *very* intermod-proof simply by adding a 2m helical filter inline. The commercial ones cost a bit ($80US or so), but it's sure cheaper than buying a whole new radio (although you do get a bit of insertion loss on rx).

I've been using a homebrew jobbie on a TH77A with a discone, and I live only 5km from the RF-din of downtown Toronto. The filter makes it comparable to my 2m/70cm non-wideband allmode transverter-driven rig. Highly recommended.

Don't use nylon rope for guys - a few years in the sun seriously weakens it.
Dacron polyester (preferably black) lasts a lot longer. Found in bigger
boating stores and advertised by some wire and antenna places.

>I want to install a Ringo Ranger on my roof which has a very steep pitch and a
>wood framed stove pipe chimney.

The single best reference for towers, guying, wind load calculations, safety, etc is the Rohn catalog. The engineering data is well worth wading through the product material to find. Roof mounting a Ringo isn't very tough, though why anyone would go to the trouble to mount a Ringo when they could put up a *real* antenna for the same effort is beyond me. :-) (There are considerably better antennas, mechanically and/or electrically, than the Ringo in roughly the same price class, but if you've got it, use it.)

It doesn't sound like your chimney is strong enough to allow a conventional chimney strap mount. You may want to use a roof ridge bracket and a length of guyed TV masting for the antenna support. Many roofers use a rope that goes completely over the roof and is secured very well to an object on the opposite side of the house. Putting knots every couple of feet in the rope will give you something to hang on to as you "walk" the roof. Some people will tie the rope to a car bumper and let it's driver *pull* them up and down the roof. *DON'T DO THIS* unless you have absolute confidence in the driver, perfect communications, and a quick way to release the rope while still having a safety line to hang onto. It's much too easy to be pulled over the ridge and down the other side with this method. If you have any doubts about how to rig for this sort of work, get a local rock climber to show you how to rig out a belaying line. Some roofers use "chicken" ladders. These are single boards, usually a 2x6, with short steps nailed on. The end of the board has a "lip" made from a piece of 2x6 that slips over the roof ridge. This kind of ladder is convienent, but don't use it without a belaying rope. A slip is still a long way down. Working on roofs or towers can be safe, and fun, but you really have to remember that a fall can kill or maim, and falls happen when we don't think through what we're doing. Never get in a hurry, always inspect your safety equipment, and use it properly.

>Gary (ke4zv), seems like most of the articles I end up filing in my HAM
>folder are from you, thanks again!

Thank you!

3285. Expand RX mod for ICOM 4GAT

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-28 15:06:40 UTC
From: drx@chinet.chinet.com
Message-ID: <C7qsn7.6yG@chinet.chinet.com>
Source record: 280844

The Subjects says most of it. I'm looking for an expaned receive mod for the ICOM 4GAT. I have a need to receive in the 471.1375 area. Also what kind of sensitivity can one expect?

thanks.
s.

>and almost everyone else followed the leader, c) some industry committee made
>the decision, d) it was believed this had the least potential for stray
>radiated i.f. signals interfering with other radio services (I have a hard
>time believing this one), and e) early radios had horrendous image-rejection
>problems unless the i.f. frequency was this high (I also have a hard time
>believing this one).

The answers are d and e. A radio using high side injection and a 455 kHz
IF will have it's image fall above the broadcast band for all but the very
lowest channels. The image will be 910 kHz above the desired station. This
also puts the receiver's local oscillator above the marine safety channels
below the broadcast band. Many of the old receivers had lots of LO leakage
and long wire antennas to couple it to. 455 kHz was about as high as you
could go and still receive 550 kHz using no tune LC filters in the front
end. TRF radios could be tuned much tighter, but the consumer was demanding
an easy to use, inexpensive, appliance even then. The reason for the 5 on
the end rather than just 450 kHz was that this would put the LO radiation
between channels for listeners at the top end of the band when their neighbors
were listening to the bottom. 5 khz hetrodynes were HiFi to the audio amps
of the day and were much less noticable than an on channel growl.

The problem I have with lithium batteries is the cost. Last time I checked, it would be about $15 - $20 for a set of 6. What if you accidentally leave your HT on the NOAA weather station - and then forget about it - pretty expensive mistake! (other scenarios are possible, but you get the drift). I can think of particular instances (such as camping trips to remote areas) where they could be usefull. Bye...

3288. Gain considerations 2m/70cm

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-28 15:44:50 UTC
From: davep@llnl.gov
Message-ID: <davep-280593084009@nirvana.llnl.gov>
Source record: 280876

I'm considering picking up a Ringo AR-270 dual band base antenna. My concern is that my 2m Ringo, that I have now, claims 7db of gain, the dual bander, on 2m, only has 3.5dg gain.

Need I worry so much?
Thanks in advance for any comments.

Hi,
Could anyone tell me how to get/validate a ham license ?
BTW, I have a license from India (VU2 NOP). And I hope
to start using ham radio either with same call sign or
be assigned a local call sign..

Thanks in advance..

Neerav

SB NEWS @ AMSAT $SPC0531
* SpaceNews 31-May-93 *

BID: $SPC0531

=========
SpaceNews
=========

MONDAY MAY 31, 1993

SpaceNews originates at KD2BD in Wall Township, New Jersey, USA. It
is published every week and is made available for unlimited distribution.

* ARSENE NEWS *
===============
The FF1STA ARSENE satellite control station has switched OFF the VHF mode
Thursday May 27 until Tuesday June 1st. The ARSENE team needs some rest
during the weekend and does not want ARSENE to develop any problems while
the control station is vacant. As a consequence of switching the VHF mode
OFF, stations willing to help by searching for the ARSENE VHF beacon
somewhere between 140 and 150 MHz are asked to suspend the search until
Tuesday June the 1st when VHF beacon will be reactivated and Mode S will
open for traffic.

The RACE would like to thank all Radio Amateurs for the numerous messages
of sympathy we have received concerning the launch of this new Radio Amateur
satellite.

73 de Bernard, F6BVP

* STS-57 NEWS *
===============
The launch date for Space Shuttle Endeavour on mission STS-57 has been
delayed until the week of 14-18 June due to problems with a pump on the
Shuttle's main engine.

STS-57 will be a low (28.5 degree) inclination mission carrying SAREX
configuration C, which will include FM voice and packet radio operations.
The 6 member Endeavour crew includes: Ronald Grabe, Commander, Brian Duffy,
(N5WQW) Pilot, G. David Low, Payload Commander, Nancy Sherlock, Mission
Specialist, Janice Voss, Mission Specialist, and Peter Wisoff, Mission
Specialist.

* STAR WARS TEST LAUNCHED *
===========================

The US Air Force launched a "Star Wars" research rocket on Sunday 23-May-93
from Cape Canaveral, Florida to test the ability of sensors to distinugish
between incoming warheads and decoys. The early morning launch came a day
after technical difficulties forced a launch delay. The rocket carried an
800 pound payload named "Red Tigress 2" to an altitude of 235 miles.
Satellites, ground-based radar, and surveillance aircraft monitored the
15-minute flight while 13 experiments were ejected. They seperated into
about 60 objects, some visible at that altitude by the rising sun.
The rocket then splashed down in the Atlantic Ocean about 465 miles off
the coast of Florida.

* AMSAT-OSCAR-13 NEWS *
=======================
The following is from G3RUH via N2NRD:

M QST 1993 May 21. The transmitter section of the Oscar-13
mode-L transponder appears to have stopped working. Therefore,
while investigations proceed, the mode-JL session has been
deleted from the schedule. Mode-B now resumes at MA 195.

During MA 190-195, PSK telemetry is available on the S-band
beacon. 73 de James G3RUH and Peter DB2OS.

L QST *** AO-13 TRANSPONDER SCHEDULE *** 1993 May 21 - May 31
Mode-B : MA 0 to MA 130 ! Alon/Alat 206/6
Mode-BS : MA 130 to MA 180 !<- S transponder; B trsp. is ON
Mode-S : MA 180 to MA 190 !<- S transponder; B trsp. is OFF
Mode-S : MA 190 to MA 195 !<- S beacon ; L trsp. is OFF
Mode-B : MA 195 to MA 256 ! Move to attitude 120/0, May 31
Omnis : MA 250 - MA 60 !
Please don't uplink on B, 180-190; interferes with mode-S.

N QST de G3RUH 1993 May 21. Mode S will be ON for nearly 3
hours, MA 130 to MA 195. New stations appear daily.
MA 130-180 you will have to endure the coupling from Mode-B
users operating at 145.880 - 145.920 MHz. Either
work between them, use as test signals or go x-band.
MA 180-190 is Mode S transponder exclusive (plus B beacon).
MA 190-195 is Mode S beacon only.
73 de James G3RUH and Peter DB2OS

* AMSAT-OSCAR-21 NEWS *
=======================
RUDAK-2 onboard AO-21 (RS14) is now transmitting Junior's Peace Message
in Russian (female voice) in addition to the English voice. The FM mode
repeater and 1200 Baud AFSK AX.25 Telemetry are also still in operation.
A French voice will be loaded next month.

[Info via Peter, DB2OS at AMSAT-DL]

* AMSAT-UK COLLOQUIUM '93 *
===========================
Please be advised that the Eighth Annual AMSAT-UK Colloquium will take

place at the University of Surrey Conference Halls and New Space Building from AM Thursday 29th July to PM Sunday 1st August.

The Secretary of AMSAT-UK advises that there are over eighteen Papers already promised with more to arrive plus plenty of 15 and 30 minute talks, and demo without Papers being presented by members during the four days of Colloquium '93.

Please be advised that ALL delegates who attended 1992 Colloquium will receive an Application Form as a matter of course. These will be sent out to all addreses on last years file on 25th MAY 1993. Any other person or groups who wish to addend, should send a stamped addressed envelope, or 3 IRC to Ron Broadbent, G3AAJ, AMSAT-UK, London E12 5EQ England before 15th June 1993. Mark top Corner of the envelope: Request for Colloquium Application. This enables coordinators to get the applications to you posted the same day as they are received with other mail.

Please note: This Colloquium is a Satellite Get-together and we welcome ANYONE giving us their experiences, tips, technical advise and new ideas. This is a FUN by learning weekend in the South of England Countryside.

[Info via Ron, G3AAJ Hon. Sec. AMSAT-UK]

>certified to use it.

>Ron - KA5LUG

As a recognized expert witness is several courts in this area,
what goes or doesn't go depends almost entirely on the judge and his personal
preferences. Most of them simply believe that a radar ticket is uncontestable
evidence and won't even listen. Some won't even let me introduce previous
court rulings and guidelines, including other states supreme court rulings,
since they weren't in THEIR circuit. Virtually NO police department provides
certified training by qualified, independent trainers. I have never seen a
case where the device was properly licensed, tested, or calibrated. Neither
have I been involved in a case where the officer properly calibrated it on
site, AND took both a traffic history and tracking history, which are
ABSOLUTELY necessary to deternine what caused a particular reading. Your
best bet is a jury trial with a lawyer who can get the judge to listen to
expert testimony AND will let you present applicable rulings from other
courts.

3294. Gap VS.

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-28 17:46:05 UTC
From: JMG@tntech.EDU
Message-ID: <01GYPJEUO9B6JRPARP@tntech.edu>
Source record: 280848

My Gap isn't guyed and has had no problem in hurricane force winds (recent tornado close by). I think if people mounted the base in concrete like they suggest, there shouldn't be a problem.. My friends isn't even mounted in concrete.

I have owned the older Gap VI for about a year now, and my friend has owned one for a number of years. I was at a hamfest looking for a Beam and came across the Gap booth. Spent a bunch of time there and ran into a lot of very happy owners.

When I first started using the Gap-checked it out and the SWR on all bands met or exceeded the published figures. I have some different types of wire antennas up. In the first few months of testing I noticed on a number of ocassions that my Zepp outperformed the Gap by about 2 S units. I got to upset, I even wrote Gap a letter. I have my Gap mounted in the front yard between, but not real close to some trees (which means it could be doing a lot better).

Well they did answer right back. About this time in my story my 8 year old started to get licensed. I have a Kenwood 820S and between the rig needing tuning and the wire antennas needing to be tuned..no way he was going to do it all. Everytime he played with one of the newer rigs, he loved it (just like a computer, or Nintendo). So I worked a couple of extra jobs and finally found a used Yaesu 757GX at a ham fest.

Between the Gap and the Yaesu, he can just turn on the rig and start working. This ended up in my using the Yaesu and the Gap a lot. I have worked contests, 1000s of QSOs, RTTY and AMTOR.

Depends on the conditions. On 20 meters sometimes it will perform as good as a beam, sometimes even better. Found out the antenna works great on 12 and 30 and 17 meter cw.. on 17 meter SSB I think there is a mod I can do. The newer models of the Gap will do the WARC bands. I don't use 80 meters much, so I would probably get the 40-10 version of the antenna if I redid it.

Summary: it works great, you don't have to use a tuner, by far the BEST ANTENNA FOR THE MONEY. I am looking into Quads right now.. but the GAP will stay. The Gap is much quieter than other verticals and much less expensive.

Let me know if you need anymore info.

3298. Help using NEC-2?

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-28 18:31:05 UTC
From: jfw@ksr.com
Message-ID: <27307@ksr.com>
Source record: 280861

All of the discussions about the G5RV antenna motivated me to dust off my copy of NEC-2 (I'm using the actual FORTRAN version as well as a C translation), but since I lack the manual, I'm having quite a bit of trouble using it (despite trying to slog through the impenetrable source for clues). How does one model a center-fed dipole antenna? Would this be correct for the G5RV:

```
G5RV
CEG5RV ANTENNA
GW 0,21,0.,-15.54,10.36,0.,15.54,10.36,.001628
GE
GN 0 0 0 0 6. 1.000E-03
EX 0 0 11 0 1.
FR 0 1 0 0 14.15 14.15
XQ
EN
```

i.e. a single piece of wire, with the excitation applied to the center of segment 11? Or should I break it into two separate wires? Also, should I model the open-wire feedline portion as well, and if so, how do I specify the driving point? (connect a wire across the open end and apply the excitation there?)

Also, is the GN line there a realistic ground specification? (It's borrowed from one of the EX tests that came with nec-2.)

The results I get using the above specification indicates an impedance of 108-56j ohms at 14.15MHz, which isn't as close to the "90-100 ohms purely resistive" that is reported both by G5RV and Maxwell (in "Reflections").

Thanks.
John, WB7EEL

>Ed W1AAZ
>P.S. However, did you mean ("G5RV") as in a "noun" or "adj"?

Ed, I meant it as an adj...e.g., G5RV antenna. Louis Varney has
suggested variations which are generic G5RV antennas variations.
Things like open-wire feed or not, balun or not, coax or not...
Thanks for your comments and please see below...Cecil...KG7BK.

>Also, if the feedline is balanced and I'm using a balanced tuner,
>does the feedline length really matter?
>Mike Butts mbutts@qcktrn.com

Mike, in the ARRL Antenna Compendium Vol. 1, G5RV himself says,
"...almost any length may be used from the center of the antenna
to the matching network (balanced) output terminals". "A
convenient length of open-wire feeder is 84 ft". Cecil...KG7BK

>coverage for both tx and rx.

The other thing you should be interested in is spurious rejection,
'cause the extended range isn't much good if it's full of birdies.
I have the Yaesu and I'm happy with it. The sensitivity and power
output fall off out of band but the spur rejection stays pretty
good, which is not the case with some of the earlier Alinco's.

Mine covers 124 to 172 and 400 to 475 in rx, about 130-160 and
410 to 470 in tx. At the edges, rx sensitivity is down to about
a millivolt and tx gets grungy.

I don't agree with Gary. I've owned the 211, 251, 271 and 275, not to mention the 451, 471 and 475. The 211 and 251 are relatively unreliable. The 211 suffers badly from intermod. The 271, although short-lived as a product, is a MUCH better radio than either. Granted, the 275 is the best of all. However, if you're gonna be modifying it its compact design makes the 275 a bear to work on. The bigger 271 is a lot easier to deal with.

The 271 does have the much-maligned "software in battery-backed RAM" feature. If the battery croaks the radio loses its personality :-) I.e., is suitable for a large paperweight and not much else. However, I think this is minor unless you're going on a DXpedition or the like.

The same observations hold for the 4xx radios. I think the x75 radios are more expensive than they should be.

My observations are from personal experience on the satellites, not from detailed studies of the front end. A friend of mine has had his 271/471 for a LONG time (6 or 7 years?) and is perfectly happy with his. I'd definitely take the 271/471 and pass on the older radios, especially the 211.

3302. Re: VCO design questions

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-28 19:19:09 UTC
From: alanb@sr.hp.com
Message-ID: <C7r4By.8LE@srgenprp.sr.hp.com>
Source record: 280864

cheech@ocean.med.unc.edu (Greg Young) (cheech@med.unc.edu) wrote:
: Greetings,

: I have a couple of (simple-minded?) questions about VCO design for
: PLL synthesizers. ...

: 1) Many of the PLL designs that I see use a common-gate FET oscillator
: for the VCO. The reason given is that the phase noise is lower for
: this configuration. No one explains why the common-gate oscillator
: exhibits lower phase noise. Can anyone enlighten me?

I believe the key to a low-noise oscillator design is to noise-match the resonator (tuned circuit) to the amplifying device input. (Note that noise match and impedance match are generally not exactly the same.) Perhaps the FET source is easier to noise-match than the gate.

: 2) I haven't found a discussion of common-gate oscillator design in
: my (not that large) set of references. Is it so simple everyone
: else knows how to do it? More enlightenment, please.

At microwave frequencies, a common technique is to include a reactance between gate and ground, and connect the resonator between source and ground. The reactance causes the source to exhibit a negative resistance. So long as the sum of resonator and FET impedance have a net negative resistance, the circuit will oscillate. An old but good reference is "The Oscillator as a Reflection Amplifier: An Intuitive Approach to Oscillator Design" by John Boyles of HP, in Microwave Journal magazine, June 1986 p 83.

: 3) Most of the VCO designs use varactors in a back-to-back setup,
: paralleling pairs of back-to-back varactors to get higher
: capacitance. What am I missing here? Does this contribute
: to stability or is there another reason for it?

In a varactor, the capacitance changes as a function of voltage. If the peak amplitude of the RF voltage is greater than the DC reverse bias, the varactor will be forward-biased and conduct. Using two varactors in series reduces the RF voltage drop in each to half. Also, the varactor Q improves with higher reverse bias. A large RF signal can cause the reverse bias to be near zero at the negative peak of the waveform, which lowers the average Q. Lower Q means higher phase noise.

A good phase noise tutorial is "Introduction to Phase Noise" by Constantine Fantanas Of Trionix Co. in RF Design magazine, August 1992, page 50. It has some engineering-level math, but non-engineers can probably still get some good hints from it.

An excellent series of articles on low-noise RF oscillator design by Roger Muat of HP (Spokane WA) appeared in Microwaves and RF magazine in 1984. "Designing Oscillators for Spectral Purity" July p 133, "Choosing Devices for Quiet Oscillators" August p 166, and "Computer Analysis aids Oscillator Designers" September p 211.

Finally Grant Moulton, also of HP, wrote a good short article on how to predict and measure oscillator phase noise: "Dig for the Roots of Oscillator Noise" Microwaves and RF magazine, April 1986 p 65.

Message-ID: <C7r5px.8un@freenet.carleton.ca>
Source record: 280858

Whoa minute! As a very new owner to a previously owned 251A, I'd like to have this claimed superiority between the 211 and the 251 better substantiated, or at least better explained. All the, or the beeter part of the 211's being sold on the used markets were sold as handyman's special, the PLL had gone south and either the owner was incapable of repairing them OR our local Icom distributor was unable to provide parts or service. The one 211 I actually saw working had a very crude freq generation/pll scheme and was quite awkward to use compared to the 251A.
Relating to this, what DOES the Mutek front end provide to a 251 owner that a good preamp will not?? Certainly anyone who would want to use this rig for satcoms or EME would put an outboard preamp on this rig anyway.
Could Gary or someone elaborate on this?
If not just a perceived difference, where could one get the Mutek board, if it makes that great of a difference?
thanx in advance de ve3uav

Now that Savoy Crystal has gone 10-7 out of business, we want
to find another source for crystals for our repeater linking
project.

I already know about International Crystal.

I need the phone number for Sentry Crystal. The lady
who answered their old 800 number said they changed
it 3 years ago and wishes she knew the new number;
I guess she wants to give them a piece of her mind.

As a substitute, I would settle for the place name
where Sentry is located so that I can call directory
assistance.

Send me email and I will report back.

Thanx!

>The receive audio doesn't come on for a full second or so when the

The radio most certainly is transmitting during that silent
period. That is why it says it is transmittign, by the way.
If you listen to the output of the HTX-202 (not the repeater)
you will hear that the PL tone has stopped transmitting
after the PTT is released, but the transmitter stays on
the air. This allows the PL decoder in some repeaters to
shut off, thereby eliminating noise bursts which would
otherwise occur.

Naturally, anyone listening to the repeater output would think
you had stopped transmitting, leading to the confusion you described.
Even though the repeater thought you had stopped transmitting,
the HTX was still transmitting, albeit without PL tone.

The first time I heard one of these on the air I wondered
who had the "Chicken Burst". Later, I met the amateur,
who showed me his new HTX-202.

Some background: I suspect that the HTX-202 is made by ICOM
for Radio Shack. If so, I infer from the operation of my
ICOM U-16 UHF commercial band portable radio that the HTX-202
operates similarly. Chicken Burst is the name some Motorola-type
friends of mine use to describe the ICOM substitute for
Motorola's Reverse Burst. Reverse Burst reverses the phase
of the PL tone before the transmitter drops off the air
to eliminate noise bursts resulting from PL decoder run-on.

So, after all this verbiage, you are just hearing a neat
feature of your radio. You are not hearing the receiver
come back on for almost one second because the transmitter
really is still transmitting; it is just not transmitting PL
any longer. Once it drops off the air, the receiver should
come on rather quickly.

I'm surprised that this isn't discussed in the manual. I'll
have to get an HTX-202 once they discontinue them and
get really cheap.

>What's the deal? Is this normal operation for the 202? It makes pl
>operation almost useless because of the slow operation and missed words.

Jeez, I hope you guys don't tailgate each other's transmissions
so badly that this one second pause kills the conversation!

I certainly am pleased to see that the HTX-202 gives the
option to disable that darned Touch Tone hang-time.

About the name of that function: does the Auto-Reply feature
send a Touch Tone "C" at the end of each transmission
when it is turned on? I recently heard a radio on
our repeater which did this, and the name of this feature
seems to describe it.

Please advise.

>>the pitchers reminded me of a question I once had.

I have not heard of this before, and I would have doubted that the
FCC would want to spend a lot of effort on something like this, unless
they were causing 'harmfull interference' to some other service.
If the radar was a K band radar, then a licenced Technicain Amateur radio
operator can use it under his ham licence. (we have the same allocation
under the FCC regs, and it can be fun :-)

>>the answer was that they had been told the License for the VHF/UHF
>>radios in the car would cover it. I repeatedly told them that this
^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^ What a lie!

Until circa 1986, the FCC required that all 'police radar' units be
individually licenced. Post 1986, the regs were changed du to the massive
influx of inexpensive radar units, and licencing became a real headache.
Now, your department can apply for a licence, with a $50.00 fee (that may
have change though) and a licence supporting 100 (default) is issued. No
more need to put a sticker with the licence on top of the radar unit. The
officer need only know where the controll oporating point is (ie the
technical end of the arm, so the FCC can go after them). This is also known
as a blanket licence.

<stuff deleted>

>>had received it yearly recalibration, or if it's operators had been
>>certified to use it.
As far as recalibration goes, that would only apply to the frequency
part of the regs. The FCC doesn't care if the Radar unit
reads correctly, they only care about it as it relates to tramitter
specifications.

>since they weren't in THEIR circuit. Virtually NO police department provides
>certified training by qualified, independent trainers. I have never seen a
Is there such a thing? KeyWord ^^^^^^^^^^. The only 'certified training'
I know of is from the Radar OEM, I hardly call this independent.
>case where the device was properly licensed, tested, or calibrated. Neither

The Minnesota State Patroll (at least in my district) was very good about
puting the FCC licence on top of the radar unit (clearly visible), and I
have spent many a day taking a tuning fork and placing it on a special

frequency counter to measure the osclations, and compairing it to a table
(and you had to look it up every time) of acceptiable values. The fork(s)
was then used at the start of each shift to check the radar unit. WHILE
#_OF_TROOPERS >0 DO it again. As for independent trainers, the law can vary
from state to state, and so that could be a problem.

<stuff deleted>

A good number of troopers used VASCAR. Which takes all the fun out of
a trail. If it takes you X seconds to travel 1/4 mile
than you must be traveling Y speed. Unless you and Scotty are working
on a new Physics, the ticket holds.

BTW, I worked for a Minnesota Department of Transportations radio shop in
South East Minnesota. We serviced MN-DOT, State Patroll, and just about
every other State FM two way radio. Radar was just part of the job.

NVRAM is usually works by having a battery backup. There is another way to do it using exotic compounds, but I don't think these are on the market.

>
Digital circuits generally have some amount of memory, e.g. RAMs, PROMs and flip-flops. These may store data or state information (as in the state of the device, not one of the states of the union).

X-rays are a type of ionizing radiation. When ionizing radiation passes through a semiconductor crystal, the atoms may become ionized along the track of the particle (x-ray in this case). If this ionization occurs in a device (transistor) where there is an electric field (there usually is) carriers (electrons and holes) are produced. These carriers can cause one of the bits of memory to change state (1->0 or 0->1).

I think that this is what happened to her HT. It went from the standby state to the transmit state, at least in the control section of the HT. A reset reset the flip-flop that had been flipped to the wrong state.

Do x-rays cause lasting harm? I am not sure. If they do, it is probably by damaging the oxide-semiconductor interface in a fashion similar to the 'hot electron' effect. This effect occurs during normal operation of a MOSFET. Current process technology reduces or eliminates this

problem using a modified FET design (called LDD). I do not think that exposure to these security x-rays will cause lasting damage to your HT directly.

3314. Re: VCO design questions

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-28 22:48:37 UTC
From: glenne@sr.hp.com
Message-ID: <C7rE11.DsJ@srgenprp.sr.hp.com>
Source record: 280877

Alan Bloom (alanb@sr.hp.com) wrote:

: : 3) Most of the VCO designs use varactors in a back-to-back setup,

: In a varactor, the capacitance changes as a function of voltage.
: If the peak amplitude of the RF voltage is greater than the DC
: reverse bias, the varactor will be forward-biased and conduct. Using
: two varactors in series reduces the RF voltage drop in each to half.
: Also, the varactor Q improves with higher reverse bias. A large RF
: signal can cause the reverse bias to be near zero at the negative peak
: of the waveform, which lowers the average Q. Lower Q means higher
: phase noise.

Another reason for the back-back approach is that it is symmetrical
which can reduce even order distortion products produced by the
non-linear V/C response of each individual diode.

Back to back (series) diodes generally provide half the total
capacitance as well as half the capitance change so a given diode type
may have to be operated nearer DC in order to get a given tuning range
and sensitivity. However, even if this happens the symmetry may improve
oscillator performance.

John K7SII writes:

> Recent articles have discussed the GAP, R7, HF6V, G5RV, etc. Does anyone
> have experience with the DX88? I am looking for that "perfect" HF all band
> antenna.

I've used a Hy-Gain DX-88 (all-bands 160m-10m) for over 3 years. It has the
160m add-on kit, which makes an OK (not great but OK) 160m antenna for local
QSOs (up to a few hundred miles). It works about as well on 80m as on 160, but
I am able to work some DX with it on 80.

On 40 and above, it performs very well. The bandwidths are wider and efficiency
much higher. I worked about 100 countries on it before I put up a beam.
Yesterday
I worked 9M0S on it running a kW on 40. It's nice to be able to
precisely tune each
band to resonate at your favorite frequency (Extra CW band for me), and
to be able to
retune 80 from CW to SSB while standing on the ground. I used it in
several contests,
running full legal limit from an Alpha 87A, and it never complained.

Mail me if you want more info. 73 Mike N6MZ

I purchased a FT-530 two weeks ago. It's the first and only rig I've
owned. I really like the radio but have'nt owned anything else to make
a good comparision. I don't use the clock function but I do use the
battery voltage display in the sub-band window. This gives a good indication
of battery capacity (watch the voltage drop while transmitting). Living
aprox. 40 miles north of Seattle, WA, I haven't noticed any intermod problems.
According to signal reports I'm getting out great with just the dual band
rubber duck. I REALLY LIKE THE RADIO. (my opinion could be slightly rose
colored in that I got my ticket in March of '92 and only just now got
my own, my very own first rig.)

>Gary

>Gary McDuffie, Sr. // ---o------\./------o---

It was a few minutes before the ARRL DX CW contest and this guy was just warmingup, besides I prefer 5 second QSO's when there's other people waiting to work the DX. It is somewhat anti-social to send your name,QTH,rig,weather and how youfeel when the DXpedition has gone somewhere to maximise the QSO rate for the deserving - one should listen, listen some more, then work the DX in the manner he prefers whether that be a contest style qso or ragchew mode.

A classic example of Liddish behaviour was demonstrated by a W6T** this morning on 10mhz - 9M0S, Spratley was working contest style when this W6T** works him and asks 9M0S for his QTH & name, upon being told he then proceeds to wax lyrical about how its been 25 years and he's never worked spratley before etc.

Then to cap it all this W6T** is heard 10 minutes later in the pile still calling 9M0S !!! maybe he forgot to get his weather report but its obvious that had he listened enough he would have realised (maybe) that names/qth were not the thing the guy on spratley wanted to hear.

Anyone know where I can get the little tool that is used on a
Collins 75S3 to loosed the set screws on the dial shafts?
It is mentioned in the owners manual as something that came with the
rig but it wasn't included in my hamfest special. The set screw
looks like an allen screw but the head of it is different.
It is needed to loosen the VFO shaft so I can set the dial pointer
to the correct upright position after calibrating the vfo,
according to the manual.

Thanks, 73 de Rick KT2Q

Source record: 280804

I guess the easiest way is to use another rcvr...assuming its something recent and can be relied upon for accuracy.

But, if you can't find someone with one you could always find or build a 100 KHz crystal calibrator.... Heath used to make one way back but you can find them at flea markets reeeel cheap.

That's a nice little rig, the hotwater 101. I used to own one, had a resistor that got a little hot though, in the audio amp stage for the mike. Mine failed one day and I figured the current through it to be more that the 1/2 watter could handle so I went to a 1 watt and it was fine after that. I cant remember where in the circuit it was....it's been so long. You should post for a manual on this rig... it is a radio that you can still work on by yourself :-)

One feature often overlooked is ctcss or pl decode. Many repeaters transmit the same pl tone used to access the repeater. You can use the decode mode to monitor the repeater. You will not hear the intermod. Quite often this feature is standard on new handhelds or is a plug-in board at added cost, but is worth the investment.

I think the feature (problem) you are describing is from an Alinco DJ-f1t
type radio...

There's a guy here that has one of them (he keeps it turned off), but he'll
turn it on for kicks....he calls it his "CB-style Roger Beep!"

I think it's a rather dumb idea....on FM, it's kinda obvious when you unkey!

Have a good 'un.

3327. Re: GMRS; type acceptance question

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-29 06:38:16 UTC
From: bwilkins@iat.holonet.net
Message-ID: <C7rzrt.80A@iat.holonet.net>
Source record: 280797

erik@peewee.nwc.navy.mil (Erik van Bronkhorst Code C02313 Phone 939-1421) writes:
: I understand WHY FCC requires type acceptance. I guess I just
: want to know
: 1. if any extended coverage 440 units are type accepted for GMRS
: operation (or why not)

Your tranceiver is probably type accepted under part 15. This covers the
emmissions from the receiver. I am unaware of any part 97 type acceptance.

: 2. what I must do to gain type acceptance for a unit in
: my possession that I believe will meet emissions regs.
: (or why I can't get there from here...)
:

Only the manufacturer can apply for type acceptance. Most of the Japanese
manufactures of amateur gear also sell similar type accepted radios for
commercial service. Of course they sell for a bit more money. Most seem to
have better front ends as they dont seem to be prone to the usual intermod
and noise associated with amateur broad band receivers.

: Thanks

VK2SG RTTY DX Notes, 28 May
VK2SG RTTY DX Notes for week ending 28 May 1993 (BID RTDX0528)

So many times we hear (AMATEUR) Radio Operator and a nice (HOBBY) to
be in. Well, let me tell ya, we are more than Amateurs. We are
HAMS!! and as Hams it is more than a hobby. Our main objective is to
promote Good Will with other countries. So remember the next time
asked, forget the words, AMATEUR and HOBBY. Tell them you are a HAM
and PROUD of it.

Our information this week came from 9X5LJ, CE3GDN, DJ3IW and The
Central Europe DX-CLuster, KE5GA, N5PSI, W2JGR and the NJ0M Node Twin-
Cities DX Packet Cluster Network, W5KSI, ZS5S. Thank you all for your
assistance.

Notes of Interest.

Eritrea. Norwegian Expedition to Asmara will take place 31 May to 9 June. Setting up a Club station and on the air operation. This one is expected to reappear on the DXCC Countries list shortly. No call mentioned at this time.

Libya, 5A. Romeo announced that the licensing had been taken care of. The antennas are ready, awaiting few more pieces of equipment before commencing operation, which could take place as early as the end of this week. No callsign mentioned. RTTY?

Tunisia, 3V. Romeo also said that this DXpedition will be postponed until August, to allow for better propogation. This will become a Multi-National undertaking, with a total of 16 operators for 10 days, ALL Bands, Modes, including RTTY.

Somalia, T5. KF6BL/T5, reported last week as rejected by the ARRL DXCC desk, due to lack of Documentation, is now good.

For next weeks bulletin, please direct your Notes and Bandpass to Jules, W2JGR @ CE3GDN.#STGO.CHL.SA

Remember, DX Don't Sleep.

3329. New Tech questions?

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-29 13:24:37 UTC
From: bb19s20@instem.uucp
Message-ID: <bb19s20.049k@instem.uucp>
Source record: 280799

Anyone possibly know where I could get a copy of the New Tech questions in possibly a computer type program? I used to have an older version of a PC prg with the Tech questions but I know it's out dated by now. Thanks in advance.

Bill N8XRC

3330. HAM-server HELP

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-29 15:15:42 UTC
From: KA6ETB@GRAFex.Cupertino.CA.US
Message-ID: <gate.w99a5B1w165w@GRAFex.Cupertino.CA.US>
Source record: 280808
Cross-posted to: rec.radio.amateur.packet,rec.radio.amateur.misc,sbay.hams

All you might ever want to know about the KA6ETB HAM-server

Hardware:
========

386/25 PC clone
Telebit QBlazer modem
20-Meg file space reserverd for archive

Software:
========

Waffle 1.65
WFSmail 2.03

General Information:
===================

Orders for files are filled between the hours of 0200-0400 daily. This is so those hosts through which the traffic is forwarded are not overloaded. Since we all depend on the generosity of others to carry the mail, it behooves us not to make them angry.

ASCII (text) files are split at about 30,000 bytes or 700 lines (which ever comes first). UUENCODED binary files are split at about 750 lines.

If you are using a PC and you do not have UUDECODE, follow these steps:

1. Order UUDECODE.BAS or UUDECODE.C, and UUEXE515.ZIP.
2. Compile UUDECODE.BAS or UUDECODE.C on your system.
3. Use the resulting executable to UUDECODE UUEXE515.ZIP. UUEXE515 has documentation about UUENCODE/UUDECODE.

You are all set to start ordering binary files from HAM-server.

/hamradio/newfiles/ contains files that have not yet been categorized. You can order a list of newfiles by sending the following in an email.

NEWFILES <date>

<date> is in the form of MM-DD-YY, and is required.

If you order a file and do not get it, check the index to be sure you have spelled the filename correctly. If you have ordered the file correctly, then order a new INDEX, as I may have moved the file to a different directory. The system is still expanding, and I am trying to keep it in managable chunks.

Also, if you have ordered files from HAM-server and do not receive them, it might be because your return path is incorrect. My bounce mailbox fills up quite regularly with bounce messages. And, since the path is incorrect, I cannot contact you to let you know.

Orders must be sent to HAM-server. Orders sent to KA6ETB or HAMSinfo are ignored.

A new INDEX is automatically generated every Sunday and when files are moved or added.

Message Command Language:
==========

There are some general rules for ordering files:

o Commands and operands are not case sensitive.

o Leading spaces are permitted before the command. Commands must be the first token on a line.

o A '#' character as the first character on a line is treated as a comment. The line does not cause an error.

o A line beginning with the string "--" is treated as end of input. The remainder of the message is ignored.

The commands are:

GET
HELP
INDEX
NEWFILES
PING
QUIT

The GET Command:

The GET command sends the requested file. The syntax for the GET command is:

GET <filespec> [uue[ncode] | xxe[ncode]]

<filespec> is required. <filespec> must specify a path, but without a drive specification. The filespec is not relative to any directory.

uuencode or xxencode is optional and may be abreviated as "uue" or "xxe", respectively. If neither are specified, the file is sent according to the file extension. Files with these extensions will be sent encoded:

com exe zip pak arc arj gif lzh lha zoo z tar

If uuencode is specified, the file is sent uuencoded.

If xxencode is specified, the file is sent xxencoded.

For example:

GET /hamradio/00-index.txt
GET /hamradio/utility/uuexe515.zip uue

are syntactically correct.

The HELP Command:

The HELP command gets this file.

The INDEX Command:

The INDEX command sends an index of files available from HAM-SERVER.

Use

GET 00-INDEX.TXT

to get a description of the files.

The NEWFILES Command:

The NEWFILES command sends a list of files newer that the user
specified date.

The systax for the NEWFILES command is:

NEWFILES <date>

<date> is required. <date> has the form of mm-dd-yy. HAM-SERVER is
strict about checking the form of <date>; if it does not look like
it expects, the command will be rejected.

A valid specification for the NEWFILES command is:

NEWFILES 02-15-92

The PING Command:

The PING command causes HAM-SERVER make a simple reply, via the
session transcript, to the requestor. To test the path to HAM-SERVER,
send the PING command.

The QUIT Command:

The word "quit" as the first token on a line causes HAM-SERVER to
quit processing input as if end of input had occurred.

3331. HAM-server INDEX

>as a blanket licence.

This puzzles me, then. I am a senior Criminal Justice major at one of the
colleges here in Georgia. As part of my degree, I had to intern for a law
enforcement agency. Well, I did mine at a somewhat rural Sheriff's Office
in Northeast Georgia. We had an old radar license posted on the wall..but
it had expired. I asked one of the investigators (who is a ham, and who
coordinates all the licensing for the VHF stuff) and he told me the same
thing as the other guy said...the department didn't need a separate license,
that if they had a licensed channel on hi-band then the radar was already
covered. I read a little of Part-90 at school one day and I found NOTHING
to that effect. So basically, Mr. Investigator is full of crap...or at least
he is going on a line of crap that someone else fed him.

So, what should I tell him next time I see him (on friendly terms, of course),
tell him that his radars are indeed unlawful as they aren't licensed? And,
to clarify what you said earlier, then radars are now issued on a 'fleet'
system?

Thanks....this is going to be real interesting when it pans out.... oh, on
the use of operating an X-band police radar and being a tech or higher ham,
I was under the impression that this still couldn't be done as the radar
is phase modulating and we (hams) cannot phase modulate on 10.525 ghz.
(isn't there a ham band hear Ku Band, too? (24.5 or something ghz)

Have a goodin'

John Reed

Might ask you the same question, since you quoted 'copywrited' material in
your post.

What never ceases to amaze me, is that some companies seem to think that they
can copywrite public domain data that they buy from the US Government, just
because they own a printing press.

None on mine. Does it go away when you turn the computer off? 8-)

My Amiga (MC68000 + custom co-processors) has a HUGE spur at *exactly*
146.76 MHz, which is, of course, the most active local repeater.

Peter Laws|GEnie:P.LAWS1|"The '90s are gonna make the '60s|plaws@uafhp.uark.edu

This is a Bristol spline setscrew. Xcelite and others make sets
of them, or you can buy them individually. A good mailorder source
for such things is McMaster Carr, 312-833-0300. Their catalog #7048A54
is a set of 8 of them for about $6.50.

QST:

In a recent exchange of postings about, what else?, the G5RV antenna, it went something like this;

> You probably didn't know this but "G5RV" is a generic term
>
> No I did not know this.
>
> 73's
>
> (signature here)
>
> P.S. However, did you mean as in a "noun" or "adj"?
>
> Noun: Product without a brand name
> Adj: Of a whole kind, class or group
> ...much stuff deleted...

==========
Now for my opinions,

I don't believe this to be true or else I don't know what generic means. If you mean as opposed to a brand name, I guess you're right.

Antenna is a generic term. Yagi isn't. Automobile is a generic term. Convertible isn't. Refrigerator is a generic term. Fridgidaire (sp?) isn't.

My idea of a G5RV antenna is THE antenna invented by G5RV himself! Nothing else.

When I hear someone referring to a G5RV, I assume that this is the precise antenna he is talking about. Methinks I assume too much.

Maybe this is the reason that there is so much bickering about the G5RV, everybody is talking about something different.

BTW, since the previous series of G5RV postings I've carefully queried all my contacts who use this antenna. Nearly all of them use a "tuner" with the G5RV.

This latest dialog has had a more knowledgeable group of posters than before, at least so far as being aware of what a real G5RV is.

Message-ID: <1993May30.021127.5027@wattres.SJ.CA.US>
Source record: 280816

I have a question re. the Icom IC-24AT. Where, in the front speaker grille, is the microphone located? I know my HT works but some people on the local repeater have told me that my volume/modulation is very low despite I talk into the grille at a normal speaking volume. Does anybody know where the microphone is located to I can direct my voice to that spot? Thanks

73 de Steve

3343. 2nd CFV for rec.radio.amateur reorg available by e-mail

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-30 05:15:51 UTC
From: ikluft@uts.amdahl.com
Message-ID: <40Gj03bed3fl00@amdahl.uts.amdahl.com>
Source record: 280815

The 2nd Call For Votes (CFV) for the reorganization of rec.radio.amateur has been out for a couple days now. If you didn't see it and you want a copy, you can obtain one by sending mail to
cfv-request@uts.amdahl.com
where an auto-reply program will send you a copy of the "2nd CFV and Vote Ack" as posted by the moderator of news.announce.newgroups. The program will not read your mail - it will only reply with a copy of the 2nd CFV.

A vote acknowledgement is included in the 2nd CFV. Everyone who voted should have received an e-mail confirmation from the vote-taking software. Just in case it didn't get through, a mass acknowledgement is intended to show that a vote was received. (The Vote Ack does not indicate which way anyone voted - results of the vote will not be available until after the voting period ends on 9 June 1993 at 23:59 UTC.)

I made this auto-reply server after receiving many requests for copies of the 1st official CFV. The reply-server will set the "Reply-To" header to point to the vote-taker, Jay Maynard K5ZC (jmaynard@oac.hsc.uth.tmc.edu), so you can cast your vote by replying to the message. (The CFV was posted the same way.)

Since forwarded votes are not valid, if anyone accidentally sends their votes to me, I can't forward them so I'll have to return them to the sender.

The old 75A sieres used a lot of Bristol Spline fastners. They
look like allen but with extra groves.

Xxelite makes them. I get them from many mail order co's. Jensen etc.

This may be what you have. Allen wrenches will go in but slip just
before you get enough pressure on it to move!!

Let me say that this is a Good Thing(tm) for repeaters to do. Mine is setup to do output CTCSS. However, it's not an intermod *cure*. It just reduces the irritation factor when you are monitoring the *inactive* repeater channel. Once the repeater comes up, if it's strong enough to override the crud, you'll hear it, but you're likely to hear the intermod crud too, all mixed together. If the repeater's signal isn't strong enough to capture the receiver away from the intermod, then you'll either hear silence while your S meter is pinned, or the squelch will "chug" on and off. Neither are attractive options. Output CTCSS is a useful *symptom* suppressor, but it's not a cure for the disease of intermod. Only a well designed RF frontend system in your radio can do that.

I am occasionally pestered by users who want the repeater output power raised so that their radios will work through the intermod. I strongly resist this pressure because it's not a repeater problem and I don't want an alligator at 1970 feet. I've got the output power balanced so that a *competent* radio is reciprocal with the machine, IE each can hear the other equally well.

>I think it's a rather dumb idea....on FM, it's kinda obvious when you unkey!

Sometimes it is, sometimes it isn't. It can depend on whether the receiver uses a noiseless squelch system or gives a crash on carrier loss. With noiseless squelch, it's often difficult to tell whether the other operator has unkeyed or is merely taking a dramatic pause without some sort of beep. Many repeaters use a courtsey beep for this purpose, but if you're operating simplex, letting the transmitter beep before dropping carrier is a good way to simulate a verbal "over".

3348. Modifying ICOM 24AT

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-30 14:02:47 UTC
From: rcmolden@parmesan.cs.wisc.edu
Message-ID: <1993May30.140247.11974@cs.wisc.edu>
Source record: 280820

I have been told that there is a code that you enter from the keyboard to make the ICOM 24AT into a scanner, ie that you can scan frequencies in the same way there new combo scanner/2m handy talkie does, well outside the 2m 70cm bands. Trouble is, nobody I talk to knows the numbers, could some kind soul out there tell me how to do this. Thanks.

Is this true of other radios, as well?

Well my experience certainly differs on this. My 211, early SN, was rock reliable up until the day the lightning disaster I've written about previously occurred. And it's frequency generation schene is far superior to the clunky method used in the 251. When you change modes on the 211, the carrier frequency does not change. On the 251 it jumps when changing modes, forcing you to retune. That's particularly annoying on the satellites when you may wish to mode switch CW/LSB/USB frequently when going from Morse to voice to RTTY. The display is easier to read than on the 251, and gives less trouble. The 211 is also a dream to modify, unlike the 251.

>Relating to this, what DOES the Mutek front end provide to a 251
>owner that a good preamp will not?? Certainly anyone who would
>want to use this rig for satcoms or EME would put an outboard
>preamp on this rig anyway.
>Could Gary or someone elaborate on this?

Ok, the one weakness of the 211/251 is a front end that has low intercept, and a PIN TR switching system with high insertion loss. These two combine to make a radio that performs poorly as a weak signal receiver in a high RF environment. What the Mutek board does is replace the PIN TR with a sealed Teledyne RF relay, and replace the mixer and post amplifier with a Mini Circuit DBM and FET. The phase noise of the LO is already quite low for the era, only the 275 is markedly better. The result is a strong and sensitive receiver. The board for the 251 is similar, but the phase noise of the 251 LO isn't quite as good so the results aren't quite as impressive.

The reasons you can't just fix the problem with a antenna mounted GASFET preamp are that the insertion loss of the PIN TR is high (12 db), and the existing mixer can't stand strong signals. So if you put a really "hot" preamp at the antenna to overcome both cable loss and PIN TR loss, not

only is the preamp going to be squirrelly, but strong local signals are going to play hell with the already weak mixer. By installing the Mutek board, you can use a preamp with a bit less gain, and likely an accompanying better noise figure, at the antenna to overcome cable and mixer losses, and wind up with a better overall system.

>If not just a perceived difference, where could one get the
>Mutek board, if it makes that great of a difference?

Mutek is a British company, I'll have to dig out their address and post it later.

Robert de N2JTX

3351. GMRS; type acceptance question

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-30 14:31:28 UTC
From: RGS%gms@gfimda.UUCP
Message-ID: <930530103128.d18@GMS>
Source record: 280692

The first test as to whether or not a radio is GMRS type accepted (or commercial for that matter) is if it is "field programmable" (ie. it can be programmed from a keyboard in the field). If anyone can pick up the radio and plug in any frequency they wish (like an Amateur HT), the radio would not be type accepted. As had been mentioned in previous postings as to why so many Amateur HT's had "out-of-band" modifications it was based on the fact that the electronics for the Amateur radio equipment were really the same as the commercial equipment by the same manufacturers. The only radio I ever checked into about this was the commercial equivalent of the Yaesu FT-470. It had no direct frequency entry, displayed channels instead of frequencies, but was essentially the same radio.

>to clarify what you said earlier, then radars are now issued on a 'fleet'
>system?

Georgia departments using radar have to follow two sets of rules. One
is the FCC rules, and the other is GA law. The current FCC requirement
is simply a blanket departmental radar license as noted above. The
GA requirements are that a department be certified by the State Patrol,
that radar operators have completed the state radar course, that they
follow a strict calibration procedure *each* time they set up to take
speed readings, that they can't set up within 300 feet of a speed zone
change, that they can't issue a ticket for less than 10 MPH over the
posted limit, and several other restrictions designed to discourage
the operation of speed traps.

There's a semi-amusing story related to the FCC and speed radars in Georgia. A now retired FCC Engineer in charge of the field office was stopped by local revenue enhancers. (This was pre-86) The cop starts to write him a ticket and the FCC engineer whips out *his* ID and demands to see the transmitter ID cards for the radar and the cruiser two way. The cop can't produce either. So they *both* have their violation books out now and both write the other up. The FCC has a bit more clout. The ticket was voided, and the department fined and told to stop using radar until they got their legal house in order. This same engineer cited the DeKalb county police for transmitting "false and misleading signals". They had mounted old retired radar units to the overhead signs on I-285 to make radar detectors useless due to the many false alarms. He made them take them down.

> a bit of insertion loss on rx).
This continuing thread is amazing: new people come on and ask for
advice about HTs and expanding receive coverage from DC to Daylight.
The older hands try to warn them, but they really don't want the
advice (then why ask? ;^) so they wind up with cobbled solutions that
just don't do the job they want.

IF you want to listen to RF from DC-to-Daylight, why complain when
that is what you hear...ON ALL BANDS?!?!? To then attentuate the
signal by adding outboard filters (maybe you have small enough hands
to get in there and make it internal, but a germ would need an IFR
rating to fly through my mono-band brick! ;^)

What not just plunk down a few bucks more than the price of the
helical filter (and think how much you can save by NOT buying the
DC-to-Daylight HT, but a mono or duo-bander instead! ;^) and get a
SCANNER for the wide coverage?

Seems like having two devices, each designed for what it gets used for
beats hell out of all the bitching and moaning about intermod and
noise.

If you do NOT want the advice, then don't waste bandwidth asking for
it!

>unreliable. The 211 suffers badly from intermod. The 271, although
>short-lived as a product, is a MUCH better radio than either. Granted,
>the 275 is the best of all. However, if you're gonna be modifying it
>its compact design makes the 275 a bear to work on. The bigger 271
>is a lot easier to deal with.

Of them all, and I too have been down that road, my 211 was the most
reliable of the bunch. It, and to a slightly lesser extent the 251,
did suffer from intermod without the Mutek board. (See my other post
addressing the Mutek mod.) The size of the 211/251 certainly wasn't
a deterent to servicing or modifying these radios. They're nicely
laid out, with the 211 somewhat better around the display. The
271 is certainly much bigger, but the space isn't used intelligently
to make servicing easy. The 275 is compact, but everything can be
accessed simply. And a good thing too since a VCO coil was improperly
soldered in mine.

>The 271 does have the much-maligned "software in battery-backed RAM"
>feature. If the battery croaks the radio loses its personality :-)
>I.e., is suitable for a large paperweight and not much else. However,
>I think this is minor unless you're going on a DXpedition or the like.

I think this is a major drawback. Any time a radio *has* to go back
for factory service rather than being bench serviced in the hamshack,
it's a problem. And it's all too easy to short the memory battery while
you're poking around chasing another problem. Happened to me on an IC745.

>The same observations hold for the 4xx radios. I think the x75 radios
>are more expensive than they should be.

I think a new Jeep Grand Cherokee is more expensive than it should be
too, but what are you going to do? :-)

>My observations are from personal experience on the satellites, not
>from detailed studies of the front end. A friend of mine has had his
>271/471 for a LONG time (6 or 7 years?) and is perfectly happy with
>his. I'd definitely take the 271/471 and pass on the older radios,
>especially the 211.

Well I'm still trying to pour the smoke back in my 211 from the lightning
hit. I'd rather fix it than have to work on a 271 again.

Gary

ARSENE STATUS REPORT

HR AMSAT NEWS SERVICE BULLETIN 149.01 FROM AMSAT HQ
SILVER SPRING, MD MAY 29, 1993
TO ALL RADIO AMATEURS BT
BID: $ANS-149.01

ARSENE Attitude Re-Adjustment Successful! OPERATIONS BEGIN 01-JUN-93!!

F6BVP reports that the spacecraft attitude re-adjustment for ARSENE was a complete success. And as result of this successful operation, radio amateurs can expect the Mode-S transponder to be open for traffic on Tuesday, 01-JUN-93! All are invited to use ARSENE's Mode-S transponder with its uplink frequency of 435.100 MHz and its downlink frequency of 2446.50 MHz. The successful attitude orientation change occurred on 27-MAY-93 between 03:00 UTC and 08:00 UTC when ground controllers sent the commands to have ARSENE's propulsion system to begin slowing the spacecraft's spin rate from 70 RPM to 30 RPM. The spin-down was accomplished through the firing of pressurized nitrogen gas from two nozzles located on the spacecraft. At the same time, the spacecraft attitude was changed from being inclined 15 degress to 45 degrees with respect to the orbital-plane. The 45 degree angle will provide the best compromise between antenna pointing for the Mode-S dipole antennas and for solar panel illumination. At the present time ground controllers have taken the weekend off from 27-MAY-93 until 01-JUN-93 for a much deserved rest. Consequently, they have turned off the VHF transmitter. They are still requesting that radio amateurs continue their search for the VHF downlink between 140-150 MHz when they turn it back on 01-JUN-93. If the damaged Local Oscillator (LO) crystal is still working on the VHF transmitter, finding the telemetry signal from ARENE's VHF beacon between 140-150 MHz will go a long way in helping ground controllers to understand this failure. Therefore, they encourage all radio amateurs to continue their VHF "scan" and to enjoy the operations on Mode-S from ARESENE. The Radio Amateur Club of Space (RACE) would like to thank all radio amateurs for the numerous messages of congratulations they have received concerning the launch of this new radio amateur satellite. Please stay tuned to the AMSAT HF/VHF nets and the AMSAT News Service (ANS) bulletins for any further updates about the status of ARSENE.

[The AMSAT News Service (ANS) would like to thank F6BVP for the information which went into this bulletin item. If you would like to write to F6BVP, his INTERNET address is f6bvp@amsat.org and on packet he can be reached at f6bvp@f6bvp.frpa.fra.eu. Please send your signal reports and any other telemetry data to F6BVP at either of the above addresses.]

UNAMSAT-1 MICROSAT DESCRIPTION

HR AMSAT NEWS SERVICE BULLETIN 149.02 FROM AMSAT HQ
SILVER SPRING, MD MAY 29, 1993
TO ALL RADIO AMATEURS BT
BID: $ANS-149.02

XE1TU Provides Details About A New MICROSAT

Dr. David Liberman (XE1TU) reports that a new amateur radio MICROSAT is being prepared for launch this summer by engineering students and the faculty at the Autonomous University of Mexico (UAM). This particular MICROSAT, designated as UNAMSAT-1, shares many of the same design characteristics as its "cousins," AO-16 and LU-19. The biggest difference is there will be included a special module to perform scientific experiments to determine the speed of meteorites falling into the earth's atmosphere from space. This special science "module" on UNAMSAT-1 will be contained in a an area of the MICROSAT known as the "This-Space-For-Rent" (TSFR). The TSFR was part of the original MICROSAT design and was intended to house scientific and educational experiements aboard the MICROSATs. For example, on DOVE (DO-17), the TSFR was where the special voice-speech module was located. In the case of LO-19, the CW beacon telemetry transmitter was also placed in the TSFR module. But for UNAMSAT-1, the TSFR module will contain a 70 watt RMS peak-pulse trans-mitter, a single conversion receiver with simultaneous LSB and USB detectors, and a control circuit built with a Motorola 68HC805B6 microprocessor. The microprocessor will control the pulse duration and the repetition rate for the RF pulses sent out on a frequency of 41 MHz. The pulse durations will be from 1 ms to 10 ms with a repetition rate from one pulse-per-second to one pulse every 10 seconds. This microprocessor will also perform an analog-to-digital (A/D) conversion of the received echoes and will verify if the echoes have the approximate doppler-shift that scientist normally observe from meteorites. If the echoes meet the proper criteria, then the microprocessor will increases the pulse repetition rate and start sending the digitized echoes to a Random Access Memory (RAM) buffer located on the main CPU board. This doppler-shift data will then become part of a file which that the user can then download to study and analyze. With special ground-processing software that will be made available from AMSAT, radio amateurs will be able to determine the speed of the meteorites that UNAMSAT-1 has observed. When UNAMSAT-1 is not being used for meteorite speed determination, it will perform the regular duties of a Bulletin Board System (BBS) like AO-16 and LO-19. The BBS software for UNAMSAT-1 will be the same as that used on AO-16 and LO-19. This will allow users of AO-16 and LO-19 to continue to use their stations for BBS operations as they currently are doing, but with UNAMSAT-1 they have the added excitement of participating in a space sciences experiment. The current frequencies for UNAMSAT-1 are as follows: TX1=437.200 MHz, TX2=437.060 MHz and the RX1=145.83 MHz, RX2=145.85 MHz, RX3=145.87 MHz. The pulse transmitter frequency is in 40.997 MHz. Please watch for further updates and status reports on UNAMSAT-1 in the AMSAT News Service (ANS) bulletins.

[The AMSAT News Service (ANS) would like to thank Dr. David Liberman (XE1TU) of for the information which went into this bulletin item. Dr. Liberman can be reached on INTERNET at xe1tu@amsat.org]

STS-57/SAREX Mission Scheduled For 14-JUN-1993 Lift-Off

KA3HDO reports that the next Shuttle Amateur Radio Experiment (SAREX) has been tenatively scheduled to lift-off during the week of 14-18 of June. The STS-57/SAREX payload will carry 2M voice and packet radio capability. STS-57 is the next in a series of 5 SAREX missions being planned for this year. Originally slated to lift-off 03-JUN-93, a concern about a part in the Shuttle Endeavour's #2 main engine liquid-oxygen fuel turbopump caused NASA officials to decide to delay the launch until the turbopump could replaced with another one. This particular shuttle mission will have a low orbital inclination of 28.5 degrees. Look for keplerian elements and a list of SAREX frequencies in next week's AMSAT News Service (ANS) bulletins.

[The AMSAT News Service (ANS) would like to thank Frank Bauer (KA3HDO) of the SAREX working group for the information which went into this bulletin item.]

Edge Of Space Sciences (EOSS) Prepares For First Balloon Conference

Edge of Space Sciences (EOSS) is sponsoring a National Balloon Symposium on August 20-22, 1993 at the Denver International Airport Holiday Inn, Denver, Colorado.

Subjects will include: Amateur Radio Applications, Basic Balloon Flight Procedures, FAA & FCC Regulations, Balloon and Payload Systems, Applications to Education & Science, Student Participation Projects, Balloon Organization Development, and Payload Tracking & Recovery.

EOSS also wishes to invite balloon experimenters, educators, authors and scientists involved with high altitude balloon experiments to provide papers and presentations at the National Balloon Symposium. Papers should

be submitted in electronic form. For deadline information, contact Ann Trudeau, 15487 E. Bates Ave., Aurora, CO 80013, (303) 690-1669.

Registration includes all events at the Symposium, two meals on Saturday, and a copy of the Proceedings. For more information contact Ted Cline (N0RQV), (303) 493-1136, or on INTERNET at ted_cline@hpisla.lvld.hp.com.

AMSAT-UK Space Symposium Set 29-JUL-93 to 01-AUG-93

Please be advised that the Eighth Annual AMSAT-UK Colloquium will take place at the University of Surrey Conference Halls and New Space Building from beginning in the morning of Thursday, 29-JUL-93 to the evening of Sunday, 1-AUG-93.

The Secretary of AMSAT-UK advises that there are over eighteen Papers already promised with more to arrive plus plenty of 15 and 30 minute talks, and demo without Papers being presented by members during the four days of Colloquium '93.

Please be advised that ALL delegates who attended 1992 Colloquium will receive an Application Form as a matter of course. These will be sent out to all addreses on last years file on 25th MAY 1993. Any other person or groups who wish to addend, should send a stamped addressed envelope, or 3 IRCs to Ron Broadbent (G3AAJ), AMSAT-UK, London E12 5EQ England before 15-JUN-93. Mark on the top corner of the envelope: "Request for Colloquium Application." This enables coordinators to get the applications to you posted the same day as they are received with other mail.

Please also note: This Colloquium is a Satellite Get-together and we welcome ANYONE giving us their experiences, tips, technical advise and new ideas. This is a FUN by learning weekend in the South of England Countryside.

[The AMSAT News Service would like to thank Ron Broadbend (G3AAJ), the Hon. Sec. of the AMSAT-UK organization for this bulletin item.]

RS-10/AO-21 DUAL-HOP REPORTS

HR AMSAT NEWS SERVICE BULLETIN 149.07 FROM AMSAT HQ
SILVER SPRING, MD MAY 29, 1993
TO ALL RADIO AMATEURS BT
BID: $ANS-149.07

G0NKA Provides Results Of The Dual-Hop Experiments With RS-10 & AO-21

G0NKA rpeorts that the results of Dual-Hop Experiment #3 between RS-10 and
AO-21 was quite successful. The purpose of these experiments is to make a
contacts going through two different OSCARs. The following are the a
brief summary of the results of these experiments performed on 16-MAY-93.

Window #1:
Nothing on this orbit due to too many users of RS-10.

Window #2:

Better this one. Dave G4CUO worked Oscar DJ0MY,DL1SM, and heard
PA3FMG and IK7FGE.

Date Time Sat Lat Lon QRA Separation Station Heard
Sub Sat Approximate

930516:1254.45 RS14 45.1N 15.4E JN75QC
RS10 55.7N 5.6E JO15TQ 1661 KM DJ0MY
930516:1257.10 RS14 53.3N 17.3E JO83PH
RS10 47.6N 5.6E JN27TO 1201 KM IK7FGE
Window #3:
On this orbit the transponder was switched off so we didn't get

any contacts, but it was back on for the next orbit so the new
software routine seems to be working.

Window #4:
All OK on this orbit and G4CUO worked KM3B, KA8CNI, W8TX, and
F9SR. There are other signals on the tape which will have to be
noise filtered to make them clear.

930516:1625.40 RS14 49.4N 36.4W KN89EJ
RS10 52.5N 48.2W LO42CM 1037 KM KM3B 559
930516:1627.20 RS14 55.1N 34.9W KO75KC
RS10 46.9N 47.0W LN36MV 1438 KM F9SR 559

The DoHop Group awaits further reports from many stations in Europe and USA
who heard this experiment but did not transmit. A very sucessful day with
many thanks to the ground controllers at RS3A and UA3CR, all in Moscow, for
setting these DoHop Experiments up and making them a success.

[The AMSAT News Service (ANS) would like to thank G0NKA for this bulletin
item. If you would like to learn more about the DoHop Experiments, G0NKA
can be reached at his packet radio address of G0NKA @ GB7DTX.#26.GBR.EU]

SB SAT @ AMSAT $ANS-149.08
WEEKLY OSCAR STATUS REPORTS

HR AMSAT NEWS SERVICE BULLETIN 149.08 FROM AMSAT HQ
SILVER SPRING, MD MAY 29, 1993
TO ALL RADIO AMATEURS BT
BID: $ANS-149.08

Weekly OSCAR Status Reports: 29-MAY-93

AO-13: ATTITUDE CHANGE
L QST *** AO-13 TRANSPONDER SCHEDULE *** 1993 May 10 - May 31
Mode-B : MA 0 to MA 130 ! Omnis MA 250 - MA 60
Mode-BS : MA 130 to MA 180 !<- S transponder; B trsp. is ON
Mode-S : MA 180 to MA 190 !<- S transponder; B trsp. is OFF
Mode-LS : MA 190 to MA 195 !<- S beacon + L transponder
Mode-JL : MA 195 to MA 210 ! Blon/Blat 210/0
Mode-B : MA 210 to MA 256 ! Move to attitude 120/0, May 31
Please don't uplink to Mode-B during MA 180-190. Doing so will interfere
with Mode-S operations. Mode-S will be ON for nearly 3 hours, from MA 130
to MA 195. New Mode-S stations appear daily. During MA 130-180, Mode-S
stations will have to endure the coupling from the Mode-B users operating
between the downlink passband between 145.880-145.920 MHz. Either work
between them, use them as test signals, or go to cross-band operations.
From MA 180-190 is Mode-S transponder exclusive (plus Mode-B beacon). MA
190-195 is Mode-S beacon (plus Mode-L transponder). [G3RUH/VK5AGR/DB2OS]

MIR: Many of the stations which check into the AMSAT 20M International
Satellite Net on Sundays have asked that the MIR QSL address be published.
The following address is that of Sergei Samburov (RV3DR) who acts as the

QSL Manager for the MIR space station:

Sergei Samburov (RV3DR)
Prospect Kosmonavtov. d.36, kw.96
Kaliningrad City, MOSCOW 141070, RUSSIA.

Sergei can also be reached via packet radio as RV3DR @ RK3KP.#MSK.RUS.EU
[G3IOR]

UO-22: About a month ago G0SUL added routines to monitor the callsigns of stations using the PACSAT Broadcast Protocol (PBP) server. There have been over 400 different stations heard during 30 days of operation. Many stations (about 50%) are active at least every other day. Summarizing the activity for the week ending Wednesday, 26-MAY-93: the PBP server processed an average of 3,000 requests per day, and transmitted on an average day 8 MB of data and 7 MB of directory entries. The FTL0 server daily averages over that period were 143 logins for 211 messages and 502 KB uploaded. [G0SUL, formerly G0/K8KA]

AO-21: The RUDAK-2 voice synthesizer on board AO-21 (RS14) is now transmitting PY2BJO's Peace Message in the Russian language (female voice) and also in a English language voice. The FM mode repeater and 1200 baud AFSK AX.25 telemetry are also still in the schedule. A French language voice will be loaded next month. [DB2OS]

The AMSAT NEWS Service (ANS) is looking for volunteers to contribute weekly OSCAR status reports. If you have a favorite OSCAR which you work on a regular basis and would like to contribute to this bulletin, please send your observations to WD0HHU at his CompuServe address of 70524,2272, on INTERNET at wd0hhu@amsat.org, or to his local packet BBS in the Denver, CO area, WD0HHU @ W0LJF.#NECO.CO.USA.NOAM. Also, if you find that the current set of orbital elements are not generating the correct AOS/LOS times at your QTH, PLEASE INCLUDE THAT INFORMATION AS WELL. The information you provide will be of value to all OSCAR enthusiasts.

/EX

I'm not sure I understand your questtion ... the AM detector is used to receive AM transmissions in the VHF receiving range of the 530 just like you say above ; that's what I use mine for. Most all 2m HTs these days have an AM detector. Some automatically turn it on in the air band (118-136 MHz), or like the Yaesu, the user needs to turn it on manually. I don't know of other services in the (roughly) 120-170 MHz range which operate AM besides aircraft. Anyone else know of some?

Hello:

I take care of a local area packet network in Vancouver
B.C. which consists of a hub BBS and three slave BBS's
serving some 400 users. The whole system uses FBB 5.15.

The problem we are having here is that due to number
of external realities we're getting precious few
bulletins of general interest up here. That is, the
ALLUS* and WW stuff is being edited, censored, sent to
the bit bucket before it gets to us. Efforts to find where
the blockage is have essentially failed.

What I am wondering is if there are any other FBB sysops
on the internet who could export their allus* and ww stuff
to a file, zip it, and send it to me via the internet,
perhaps twice a week.

Now I basically know squat about the internet, so if all this
sounds dumb, that's the reason. I don't know if there would be
charges involved, or what. If there were, I would, of course,
pick them up.

My sense of things is that it would be cheaper to do this
via the internet rather than a direct long distance call
to download an export file from Winnepeg as I have been doing.

Any suggestions would be appreciated.

Source record: 280683

Casually worked the CW contest on and off this weekend on Saturday evening and Sunday afternoon, running 2 watts into a dipole. Got 40 contacts and 20 countries, which seems a little underwhelming since stations were giving me serial numbers in the 4,000's. But I had fun for not being a contester.

I worked a YA1A on 14.02, which is a new one for me. Later, I worked a YW1A on 14.04, and I was worried that I might have miscopied the first call. But the YA1A gave me a higher serial no. than the YW1A, so I must be OK. Did anyone else work him and does anyone have a QSL route?

Also worked a 9H3XX, another new one. Name was Ben. Later thought I heard him sign 9S3XX. You know how those H's and S's can sound at 30 wpm. Again, anyone else work him or have a route?

Was also happy to work 3D2DM. But have his route on my GO-list OK.

My HW-8 did a pretty good job on battery power while the OMNI VI is in for a mod. And for all of you recent ladder-line antenna discussants, I was running my "all-band" antenna cut for 80m and fed with 450-ohm twin-lead, with a remote balun and tuner.

If you have used my WPX program for the Amiga this past weekend, there are
3 bugs (so far) in the program. I have fixed 2 of them and am trying to fix
the third. A version of WPX with the 2 fixes is on ftp.usask.ca in
pub/hamradio/wpx and the file wpx-fix.doc describes the problems.

3365. Re: Your Opinion on ICOM 229A

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-31 03:25:18 UTC
From: dj295@cleveland.Freenet.Edu
Message-ID: <1ubtqu$t5c@usenet.INS.CWRU.Edu>
Source record: 280685

I have an Icom 229A as a dedicated packet rig. I am very pleased
with it. The ability to work the 'wierd' splits during the
recent SAREX missions was one of the best features I've noticed.

But remember to keep the light control at it's lowest setting,
because those biggers are a pain to replace...:)

The DX-390 does have an "AM" button; it's just called "MW". By the
way, I tried that, and it looks like the thing is too smart for its own
good, because it wrapped around.

The RSGB Buyers guide had a product review of the 251E with a Mutek front end. (we don't carry this one anymore, I suspect the RSGB doesn't either--its now a bit dated) Unfortunately, no mention was made of the prior performance. Supposedly, the 12 dB Sinad SSB sensitivity is -134 dBm, with a 3 and 6 dB BW of .35 and 1.2 kHz, respectfully, with the reviewer noting a dreadful passband. (I'd guess the NF is around 2 dB) The input intercept was +1 dBm and the reviewer said the reciprocal mixing measured superbly well. Somehow I get the impression that this was a "tweaked unit, which yielded excellent numbers," even at the expense of overall quality.

>>Could Gary or someone elaborate on this?

>preamp are that the insertion loss of the PIN TR is high (12 db), and the

I've measured a IC-251A and its similar to the IC-202/402. The noise figure is around 6 dB and the dynamic range is 75 dB. (-134.5 dBm MDS).

The Dec 1978 QST has a product review of the IC-211. The sensitivity was measured at .14 uV for 10 dB S+N/N. This was in the period in which the lab was just beginning to get decent test equipment.

>existing mixer can't stand strong signals. So if you put a really "hot"
>preamp at the antenna to overcome both cable loss and PIN TR loss, not

For most people, a good tradeoff is 10 dB more gain than the (Receiver noise figure+cable loss). With 3 dB of cable loss, this is a gain of

19 dB for the stock 251A. With a Mutek board, this can be reduced to
15 dB. With an exceptionally quiet location, and a 0.5 dB preamp,
I calculate a negligible improvement in NF (.07 dB) but 17.3 dB better
dynamic range. Pretty significant, till you realize that you started
with a receiver with a 15 dB better dynamic range to begin with!

If you use a better comparison, using 14 dB of gain with the
Mutek, since the rule of thumb isn't quite accurate, the noise
figure is 0.82 vs. 0.83 dB, and the dynamic range is 18.7 dB better.
Note that for an extra .06 dB in noise figure, you get 1.4 dB more
dynamic range.

This doesn't address the problem that most really low noise figure
preamps have way too much gain--20 or 23 dB isn't unusual. One solution
is to hack out the gain in front of the mixer, which isn't for everyone.

For example:
I modified my 3456 transverter board so that it now has 8 dB of gain,
instead of 50 dB of gain at 1.3 GHz ahead of the mixer, since I always
run a GaAs FET preamp in front of it. I suspect it will hear much
better on Equinox this June, even with the multi-L, W1TKZ up there too.

This neglects the issue of what you really need. Sure, a noisy
PLL rig is 40 dB worse than a good rig in terms of ultimate
signal to noise ratio. But is this important if all you ever
hear is the satellite (the transponders aren't noted for S/N radio--
though most designers aren't faced with all the restrictions you have
up in Space). Terrestrial interference can certainly be a problem--but
a better receiver isn't the only solution. 432 EME has been made much
easier by cleaning up antenna patterns. Perhaps the same might
be true for satellite work.

BTW, Spurs on the LO can be a *real* problem. A 78L05 with an inductive
input can oscillate, putting spurs around 1 MHz or so from the carrier.
Imagine what these spurs do even the best mixer. It can make interference
from FM stations unbearable, no matter how good your mixer.

I note that if you put a 96 MHz crystal in your no tune 2304 XVTR,
and have a 142.5 MHz receiver, this will probably cover Arsene at 2446.5.
Wideband equipment has its advantages for microwave work.

Hello to all-

I am trying to decide between the HyGain th11dx and the Mosley Pro57a
antennas.

I am interested in hearing from current and/or past users of either of
these antennas. Comments about electrical and mechanical performance
would be very helpful, but I'd appreciate any other observations.

Thanks and 73!

Maybe some one could answer this fellows questions instead of providing
him with a complete analysis of AM vs. FM detectors. From the Yeasu
manual, page 35:

Your FT-530 has an AM detector that can be enabled on the VHF
receiver to permit reception of AM signals (useful for air-band
reception...) To turn it on:
Press f/m (function key) then SET then f/m then VFO ("A3 ON" will
appear). Do the same thing to turn it off, i.e.:
f/m ---> SET ---> f/m ---> VFO.

I have had my DJ-880 since February. I did bothe the Transmit and recieve
receive mods. I have since undone the receive mod because the intermod
was so bad. I also undid the transmit mod but it screwed up my UHF
transmit capability so that mod is back on. Id you need/want lots of
receive capability get a scanner. It works better.

There are the Morse tutor called cw, a vt52 terminal emulator for the serial port which can be used for packet, may be some math radio/electronics equation solver, the universal infrared remote program (don't know if it can remote any ham infrared device), may be supporting the "cloning" feature of some radios thru the mic/sp from serial port, which you can edit and download back (known to work on computers, should work on 48 but not tested), a 1750Hz tone burst generator ?.

May be more but some are not tested and just are my thoughts. Some are not doable without extra hardware, such as DTMF encoding.

I dunno about that. At least one of the Strange Antennas I have Built(tm) never resulted in a contact. It was an indoor 15m Slinky vertical. I took a Slinky, cut it to roughly the number of turns needed to make a half-wave(or was it a quarter-wave?) of wire and stretched it between a hook in the ceiling and the end-post on my bed. Attached coax shield to the bottom, and the center lead thru a variable capacitor to an alligator clip for a tap on the antenna. We(me and my brother) managed to get it to match, but never made a contact on it. There's probably some correlary to Murphy's Law that dictates that the major lobe was probably near vertical, thereby making the antenna useful only for 15 meter moonbounce or space communications.

*** Welcome to rec.radio.info! ***

Welcome to rec.radio.info, a group that aims to provide a noise-free source
of information and news for the entire rec.radio hierarchy.

Two introductory articles about rec.radio.info are posted to the group and
to news.answers every two weeks. You are now reading the first article, which
explains what rec.radio.info is, and answers some Frequently Asked Questions.
The second article is titled "Submission Guidelines", and you only need to
read it if you want to submit an article to rec.radio.info.

You can skip to the next section of this article by searching for the next
" -- " string. The sections available are:
- What is the purpose of rec.radio.info?
- Why are messages almost always cross posted to rec.radio.info?
- What is a 'follow-up', and what does 'moderated' mean?
- OK, so now I know what 'moderated' means. Tell me more.
- What type of material is considered inappropriate?
- I do not have access to news, how can I get the information posted to
rec.radio.info?
- Will the material appearing in rec.radio.info be archived somewhere?
- I have a regular posting with timely information, is there a way to
speed up it's delivery, or automate for more convenience?

-- What is the purpose of rec.radio.info?

The purpose or charter of rec.radio.info is to provide the Usenet community with
a resource for information, news, and facts about any and all things radio.

All the other rec.radio groups are intended for discussions and general chit
chat about radio. Rec.radio.info will contain informational, factual articles
only. Follow-ups are redirected to an appropriate other group, and further
discussion (if any) will not take place in rec.radio.info.

In order to ensure that rec.radio.info contains only appropriate articles, it
was decided to create the group as a moderated newsgroup.

-- Why are messages almost always cross posted to rec.radio.info?

It provides a "tag" for each article to be assembled into a filtered
presentation in rec.radio.info (even with cross-posting, only one message, with
```

a unique Message-ID, is propogated across the net). This tag also facilitates a pre-existing method of dropping or cancelling the articles locally within the discussion groups if you don't want to see them. This accommodates individuals who want to separate the bulletins from the discussions, discussions from the bulletins, as well as those who are adamant about not reading another newsgroup and wanted to see everything all in one basket.

With the total size of Usenet (in number of newsgroups and total traffic) doubling every year or so, this is no insignificant contribution to reducing information noise and chaos. Making the discussion groups a catch-all, and making extra newsgroups filters on that catch-all, is also the most realistic way to implement such a scheme (It's not intuitively obvious what the charter, contents, and general appropriate topics for each and every newsgroup are. Seeing FAQ's and charter/intro postings in the home newsgroup is beneficial for new readers).

By cross-posting one only is adding a few tens of bytes to each bulletin (to specify the extra group on the Newsgroups line), but are adding the capability for very powerful filtering features available on most news servers, listservers and readers. Your local news guru could probably explain these features in more detail.

In rn, for example, according to Leanne Phillips in her rn kill-file FAQ, add a line of the form:
/Newsgroups:.*[,]rec\.radio\.info/h:j
either in ~/News/KILL (if you don't want to see rec.radio.info articles anywhere) or ~/News/rec/radio/amateur/misc/KILL (if you don't want to see them just in rec.radio.amateur.misc). The latter method means your kill file will only be consulted during rec.radio.amateur.misc (and hence runs more efficiently), and will probably work for most people.

In nn, according to Bill Wohler in his nn FAQ, add a line of the form:
rec.radio.info:!s/:^
in ~/.nn/kill (if you don't want to see rec.radio.info articles anywhere), or put the following lines:
sequence
rec.radio.info
rec.radio.
at the end of ~/.nn/init in order to see all the rec.radio.info bulletins first, then read the remaining rec.radio.* without the bulletins.

-- What is a 'follow-up', and what does 'moderated' mean?

If you are new to Usenet and are not familiar with the terminology, you might want to read the general introductory articles found in the newsgroup news.announce.newusers. Doing so will make your life on the net much easier, and will probably save you from making silly beginner's mistakes.

If you think that at this moment you are reading an echo, a conference, or a bulletin board, I'd also strongly suggest a trip over to news.announce.newusers.

For the rest of this article, I will assume you have a basic knowledge of Usenet terminology and mechanics.

A moderated group means that any article that needs to be posted to the group has to be accepted by the moderator of the group. Since we need to ensure that followups to an article (discussion) do not show up in the rec.radio.info newsgroup, the `Followup-To:' header line contains a newsgroup that is appropriate for disussions about the specific article.

-- OK, so now I know what 'moderated' means. Tell me more.

Rec.radio.info is a moderated newsgroup, which means that all articles submitted to the group will have to be approved by the moderator first.

The current moderator of the group is Mark Salyzyn. Submissions to rec.radio.info can be posted, or e-mailed to:

rec-radio-info@ve6mgs.ampr.ab.ca

Comments, criticisms, suggestions or questions about the group can be e-mailed to:
rec-radio-request@ve6mgs.ampr.ab.ca

But before you do so, please be sure to check out the "Submission Guidelines" article.

The influence of the moderator should be minimal and of an administrative nature, consisting chiefly of weeding out obviously inappropriate articles, while making sure correct headers etc. are used for the appropriate ones.

-- What type of material is considered inappropriate?

There are three broad categories of articles which will be rejected by the moderator:

1) Requests for information: rec.radio.info is strictly a one-way street. I receive information in my mailbox; I then post it to rec.radio.info. Requests for specific information belong in the normal discussion newsgroups. If your request gets answered, you might consider passing the answer on to rec.radio.info, though. Especially if you can edit it into a informational, rather than a discussion, format.

2) Obvious discussion articles, or articles that appear unsubstantiated.

3) Commercial stuff: a relatively unbiased test of a radio product would be accepted, but any hint of for-profit might be reason for rejection. For three reasons: This is not the purpose of the list, for-profit is a controversial topic, and this list may be passed onto Amateur Packet Radio (where for-profit is prohibited except under certain provisos).

rec.radio.swap (or possibly comp.newprod) may be more deserving of the posting in any matter.

Similarly, copyrighted material generally cannot be used. If it's TRULY worthwhile to the net, I would recommend obtaining permission from the copyright holder. Please note the source, and if permission was given. I

reserve the right to make the final decision concerning appropriateness in all situations. In most cases, a brief summary of, or pointer to, the copyrighted information may be all I can allow.

-- I do not have access to news, how can I get the information posted to rec.radio.info?

brian@UCSD.EDU (Brian Kantor) has kindly supplied a mail list server for rec.radio.info. Non of the articles will be digested, due to their size, so you will receive individual mailings for every article posted to the group.

Mail sent to radio-info@ucsd.edu will be forwarded to the moderator and thus is an alias to rec-radio-info@ve6mgs.ampr.ab.ca

To subscribe and unsubscribe via the listserver; the format for that is

sub address radio-info
unsub address radio-info

where 'address' is your full mailing address. Send this request to

listserv@ucsd.edu

Note that the server will automatically delete any address that bounces mail. If you leave the address portion blank, it will try to deduce your address from the mail headers. This may not work if you are on bitnet, milnet or some other non-Unix host, so it is recommended to put your return address in any case. For example:

sub mymailbox@myhost.mydomain.mil radio-info
or
sub MEMEME01@DMBHST.bitnet radio-info

or something like that.

-- Will the material appearing in rec.radio.info be archived somewhere?

Yes. Still firming up details at the moment but here is a preliminary list:
- unbc.edu as maintained by Lyndon Nerenberg <lyndon@unbc.edu>
- nic.funet.fi maintained by Risto Kotalampi <rko@cs.tut.fi>
saved to /pub/dx/text/rec.radio.info currently stored as numbered files.

Effectively this means that anything you post to rec.radio.info will be permanently stored, so your work will not be lost.

-- I have a regular posting with timely information, is there a way to speed up it's delivery, or automate for more convenience?

Yes, there is! It may take a bit of chatter with the moderator, but we are willing to take responsible people and provide them the means of posting the articles directly from their site. We will try everything we can as we fully realize that DX (distant signal) and astronomical data can be somewhat transitory. We are also willing to allow regular posters of information the same courtesy, even if the information is not as time critical.

We refer to this as self-moderation, which is partly based on the model for news.answer. This requires co-operation and good will to be beneficial to the community in the rec.radio hierarchy.

I suggest reading the posting guidelines for more information. I am open to suggestions.

I thank the following individuals for their input into this article:
rec.music.info moderator Leo Breebaart rec-music-info@cp.tn.tudelft.nl
rec.radio.broadcasting moderator Bill Pfeiffer wdp@gagme.chi.il.us
Paul W. Schleck, KD3FU pschleck@unomaha.edu

Humph! and I thought I'd said the only nice things about an ARRL book.

I was thinking generally about books, commercial magazines and
society published journals (Radcom, QST etc)

I think things were once better, and that the periodicals are maybe
the best example. Radcom tries to publish a couple of "Technical"
articles per issue, but these are really constructional articles on how
to duplicate some piece of gear, what is lacking is much of an
explanation of how the thing works and how it was designed. The articles
are dominated by accessories, although there is the odd transceiver
(regrettably transceiver=longer article and the explanation is the first
bit to go as it would be incomplete as a construction project were
anything else pruned) Radcom had some fine articles in the past (EG
Hardcastle on ladder filters) which they probably would not publish
today. I remember the old Shortwave Magazine when edited by G6FO with
detailed descriptions of the modus operandi of noise limiter circuits,
of systems to self tune SSB (That maybe didn't work anyway)

I feel that amateur radio, on average, is getting less technical and
that publishers are tracking this trend. This supports the trend as it
reduces the possibility of someone with latent ability coming across as
much that could trigger their interest. You just have to look at the
design flaws in much of the commercial gear, and the need of our
respective countries for the talent to reverse the flow of manufactured
goods in order to feel a little bit sad about opportunities being
missed. In Britain engineers are pictured as men with oily rags and
spanners who fail to fix washing machines, in the US it may be a bit
better (Railroad train drivers?) but in Germany and Japan more of a
picture of wealth creation must come to mind.

These matters always come down to opinions, I suppose, but I feel
sure that technical levels ON AVERAGE, have been falling slowly for some
time.

Cheers,
David

3376. Bad News For Blind U.S. Hams :-(

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-31 15:22:41 UTC
From: davros@thumper.cc.utexas.edu
Message-ID: <1ud7s1$j4r@thumper.cc.utexas.edu>
Source record: 280698

If anyone caught this week's Newsline broadcast, then you know what I'm talking about. If not, well, you soon will. :-)

The FCC has told a blind Advanced Class ham that he cannot administer VE examinations because he's not able to "observe" the candidates, as per the rules in Part 97 (this because of his blindness). Simple as that. His club or whatever wouldn't let him help with their tests; he filed a discrimination' complaint with the FCC, who took some time in reaching a decision. Their decision was to say that the club was right in not letting this fella administer exams.

My personal view on this, as a blind Extra Class ham is that the FCC is wrong. Blind people can (and have) given exams (both as teachers and professors, to sighted students and I'm certain as VE') for quite some time now. They have done so successfully, since these teachers are still employed ... The fact that these blind people are blind has not hindered their ability to "observe" their surroundings. This is probably one of the silliest (and stupidest and lots of other things) thing I've heard from the FCC in some time.

A bunch of us were talking on a local repeater about this last night, and I've this (in collaboration swith my local others :-)). Someone said that their only problem would be if all three VE's were blind. (I'm sure I could set up this situation.) Considering the unique situation that VE's are in, I can think of only a few ways in which this could reasonably happen. First, let me say that most times, blind people use live readers to have such things as tests read to them (for grading and for taking as in college), as well as other print material. Since prospective candidates want their answers graded _now_, this would be impractical unless someone brought their reader, in which case one can argue that "someone" can watch the proceedings ... at any rate:

A) The room is full of blind people taking tests and all the tests are being given in an accessible format.
B) One of the blind VE's has some vision (i.e. leglally blind) who can help mre easily grade things.
C) For those unable to read Braille, the tests could be given orally, as they are with blind people taking them as it stands now.

In all of these situations, the VE's are still in control. If there is one or two blind VE's, they would still all be in control of the situation, imho. Anyway, I think everyone gets my point, that the blind can competently administer VE exams. (BTW: I think it's time I send off for my VE certification. It's something I've been putting off ...)

The NFB convention is coming up next month. I'm sure this will be discussed there. Any other comments on this, pro or con? (Yes, it's a can of worms that has nothing to do with codeless techs!!)

Oh, and one other thing: People wouldn't like me as a VE if I had my way,
but not because I'm blind. I think that a sending test should still be required
for tests that require code proficiency. (But, let's not talk about that. I'm
sure that most of y'all disagree with me, and that's no news. Besides, since
the FCC stopped that 18 years ago or so, at least, I guess that I can't have
my way after all [as everyone breathes a sigh of relief].)

Ok Gary, tnx for the response, very thought-provoking! If you can find the address for the Mutek board supplier, it would be very much appreciated.

I would think, at first glance anyway, that replacing the mixer would be a good idea. However, I would be loathe to replace PIN diodes with a mechanical relay, IF it meant slower TR switching times. I believe that 9600 baud packet will be coming to the Ottawa area soon, and I'd hate to slow the rig's TR switching. Perhaps a simple replacement of the existing PIN diodes with newer, less lossy components would work. One could have his cake and eat it too! :-)

I have never seen a review published on either the 211/251 rigs, what would the TR switching time be?

As for the "clunky" PLL on the 251, this arrangement is similar to that which I've seen on commercial (certain) rigs, where for some obscure reason they don't publish the carrier frequency, but the centre of signal. Concur with that point, OM!

What is the active device used on the Mutek mixer?

tnx agn for the advice.

3379. Info needed: operating in France

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-31 16:30:14 UTC
From: tucker@gauss.eedsp.gatech.edu
Message-ID: <1993May31.163014.1714@ee.gatech.edu>
Source record: 280701

Hello all. I'm lucky enough to get to spend this summer studying in France.
Thanks to the very helpful people at ARRL HQ, I have the info and forms
regarding reciprocal licensing in France. However, I had a couple questions
about operating.

First, I intend to take my Icom IC-32AT over. I know that there is a repeater
near Metz, where I will be living. Do French repeaters require the 1750 Hz
tone burst to access them? If so, can I modify the 32AT to generate it?
I have the schematic and could change the diodes so it's a 32ET. Will that
do it? Or should I practice my whistling?

Secondly, are there any French hams on the net who are reasonably close to
Metz, in Lorraine? I'd like to get together with other hams, but I won't
have a car so the distance I can travel will be limited.

Finally, it looks like licensing in France is very straightforward. But,
any hints would be appreciated. Also, if anyone has obtained a reciprocal
license from Moncao or Luxembourg, I'd be interested in knowing how difficult
that was. I might have time for a mini-DXpedition.

Thanks es 73

Here is my review (totally non-technical) of the
Oak Hills Research Spirit:

Description:

Single Band kit for 80, 40,30,20,or 15
Curtis Chip keyer (8044ABM)
Superhet receiver with diode ring mixer and RF pre-amp
4 pole crystal ladder filter followed by an on board audio filter
Switchable HP AGC circuit with manual gain control
2 watts audio output
VFO with 8:1 vernier drive
Sinewave sidetone oscillator w/frequency and level controls
QSK
5 Watts output
12vDC
4"X6 1/4"X6 7/8" weighs 47 oz.
100% complete kit with pre-wound coils, PC boards are quality
double-sided and plated through and screened.
==========

OK, that is what it says in the catalogue. I opened the box and checked things out. There is a stack of stapled sheets that are the instructions. There are large part overlays, a chart showing you how to read the resistor codes, a detailed and well thought out parts list. and the schematics.

This kit isn't the Heath step by step approach. The first page tells you some general things about assembling the kit and soldering and be careful type comments. The first step is to find all the parts and make sure they have been sent to you. Next you find the Receiver board and then it tells you to put in all the resistors followed by the capacitors. The next steps do go through what you need to do. As the process itself would get more unclear the directions get clearer.

After building a number of kits I find I like this approach best. I first check off all the parts and label them on a piece of paper and stick the wires through. This gives me a chance to make sure all the parts have been included, familiarizes me with the parts and gives me a double check about putting the correct parts in the right holes on the board. I check them once while I am going through the parts check off and then again before I place them on the board. I also find that checking off the parts is my least favorite part, and when I do it this way, when I start to build I don't have to go hunting for parts. Since I have started to use this approach, my projects seem to work correctly

the first time (except for putting in an audio chip backwards and smoking it.. well no one is perfect and I was able to get a replacement for $2.00 at Radio Shack). I found the way the parts were listed on the instructions made it very easy to identify them and check them off. I found almost all steps in the final construction to be very clear and unambiguous. I do a lot of documentation at my job. I find that most instruction sets have places where the author meant one thing and the words indicate something else.

OK, now for the kit. I think there were over 170 resistors in this kit. It took me quite some time and energy to sort out the parts. I found ALL the parts to be of top quality. The enclosure is excellent. I didn't see any hint of cutting corners in any piece that was included with the kit. After building kits from about all kit manufacturers, the quality of the parts in this were the best. I have found that Ramsey uses some quality parts and some real garbage..I think Ramsey's enclosures are real ripoffs.

The board was the single item that impressed me the most. Like it says it is high quality plated through. You heat the joint and the board sucks up the solder. The result is that you will be proud to show either side of this board to anyone.. my wife comments on how her needlework is beautiful on the front side, but she won't show the back to anyone, well many of my projects are like that. With this one, I felt like displaying the board in an art show.. what a proud pop I am. The silk screening on the receiver board was ok, but certainly not great.. I found I put one piece in the wrong place because I couldn't read the part #. Well this really isn't a problem, and it was my fault. There is a clear large part overlay that makes it a breeze to build.

The receiver board is jam packed with parts.. but the back of the board is layed out so that if you use a fine tipped soldering iron you really shouldn't have any problems with solder bridges. The transmitter board was a lot less dense.

The Keyer board isn't plated through and not near in quality to the other 2 boards.. be careful with this one.. I found it not nearly as much fun to solder to as the other boards.

Once I got the parts checked off and labeled, I found it very easy to assemble. The first part of the instructions that tell you to put on about 200 parts are a mere 2-3 steps. Then when you put in the rest of the parts the instructions (like assembling the chassis, the final wiring and alignment) are detailed and clear. There are no checks as to whether you have built it right.. like Heath's resistance checks, when you are done, you power up and pray.

I was real careful with this kit, but got a little too excited at the final assembly and had put one teeny weeny audio chip in backwards.. boy did I feel dumb.. and when I powered up.. the smoke came out.. it failed the smoke test (or is it it passed the smoke test, but failed to work). It was very easy to spot the mistake, and since the chip was on a

socket, it was a breeze to correct. I checked the resistors and other parts that fed it, and no problem at all.

The final alignment suggests a frequency counter. I can't ever get the frequency counter in my MFJ antenna analyzer to read such low levels, so I use my 757GX as my alignment tool. You just need to set a coil and a capacitor to set the full 100kc bandwidth for the VFO. I take a piece of copper wire, stick it in the antenna jack of my 757 and hold the loose end over the oscillator circuit. It works just fine. The rest of the alignment had some aspects I have never encountered before. You tune the pitch of your TX out signal and the sidetone pitch (I once again used the 757, put both rigs on dummy load, transmitted and set the Spirit for the same note as the 757. I figured the Yaesu people knew what they were doing and had the proper equipment when they did it). The TX alignment I used my Oak Hills QRP wattmeter and you simply adjust a variable resistor for power level and then 2 coils for maximum output. I spoke with Dick at Oak Hills who suggest you tune it for the full 5 watts out to get the best quality TX signal. Over the weekend I took the case off a few times and tweeked various things. A note about the keyer weighting adjustment. I started at the suggested middle position. The keyer was acting really funky... couldn't really set it right. I turned the weighting adjustment and it is now perfect..one of the better keyers I have used..guess that is why a lot of people use Curtis chips. One of the adjustments that you peak .. be careful that you are on the right sideband.. I didn't have much audio level to my speaker, when I went and re-read the instructions, it had cautioned me about it.. went back and re-adjusted and everything was fine.

Ok, now for the real stuff.... how did it work. Well let me tell you that the weekend of the CQ WPX CW contest is quite some time to test out a new QRP rig. The rig puts out a full 5 watts (I turned mine back from a little over 6 watts.. may have to have a friend put the oscilloscope on it to check the signal out). The keyer works real smooth.. full break in.. but has a minor little click in it.. don't think the click is going over the air.. I have listened on another receiver. The receiver at first deceived me and I will need to do some more testing. The bands were really crowded in my QTH. The big guns were using big ammo. The rig doesn't have a narrow and wide CW filter switch. This worried me. During contests it is real nice to have a narrow filter available. I tuned around and noticed that when the receiver got a signal, you really only heard that one signal. At first I thought that this was caused by the receiver being too insensitive. After spending the entire weekend of the contest testing the rig out, I found that if I could hear them on the other rig, I could hear them on the Spirit without other station interference. I am not as of yet a person who possesses enough electronics knowledge to go in and analyze the circuit and do comparisons. I can do extensive "real-life" tests.. which from my experience sometimes had more truth than theory.

I worked over 125 stations with my 5 watts and Gap vertical during the contest. I worked to Russian stations, a S50S I think it was, an

Italian, a French, Alaska, a bunch of islands, and from the West Coast to the East Coast and some other places in between. After I got the hang of it, I got many returns on my first call.. not bad for 5 watts and a vertical.. used the built in keyer, not my contest keyer and my Bencher paddles.

Other impressions: I would have left out the AGC on and off, the RF control and made the keyer an option. I use a straight key most of the time. The rig is BIG and HEAVY. A little smaller than my HW9, but not much smaller. The chassis is solid... lots of metal. I think Oak Hills can keep the best parts of this kit, get rid of the extras, and maybe add a narrow filter and a S meter. I think they are coming out with something like this in the near future. For a station QRP rig, it would be pretty hard to beat this though.. and for portable operation it would also be excellent, a little too big for backpacking.

3381. RACES Bulletin #276

TO: ALL EMERGENCY MANAGEMENT AGENCIES VIA AMATEUR RADIO
INFO: ALL RACES OPERATORS IN CA (ALLCA: OFFICIAL)
ALL AMATEURS U.S. (@ USA: INFORMATION)
FROM: CA STATE OFFICE OF EMERGENCY SERVICES (W6HIR @ WA6NWE.CA)
2800 Meadowview Rd., Sacramento, CA 95832 (916)262-1600
Landline BBS open to all: (916) 262-1657
RACESBUL.276 DATE: May 31, 1993
SUBJECT: MGT - Radio Officer or RACES Radio Officer, which?
One will see both titles in our discussions on communications volunteers in government service. While it may be of little significance in your government, here is how we define them to those who may just be starting up a communications program.
A RACES Radio Officer is basically as described in the FCC Rules and Regulations: that person who directs a local government's Radio Amateur Civil Emergency Service program and is responsible to its civil defense director.
We utilize the title of Radio Officer, without the word RACES, to mean one who coordinates the RACES and more. Such a Radio Officer is concerned with all of the two-way radio systems in a local government, whereas the scope of a RACES Radio Officer is confined to the RACES. Thus the Radio Officer works not only with Amateur Radio but one or more of the following: Civil Air Patrol, Local Government, Fire, Police, Special Emergency, EMS, MARS, Citizens Band, other FCC radio services and those of the Federal government.
Some governments have only one or two RACES Radio Officers who, in turn, call upon ARES resources for support as needed. This is not necessarily a Radio Amateur Civil Emergency Service, however.
We urge that you encourage your RACES Radio Officer to become familiar with the capabilities and shortcomings of all your local government's telecommunications so that you may be better served by your volunteers. There is no time to train and explain when called out in an emergency.

3382. Nickel-hydride batteries (UPDATE)

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-31 17:45:56 UTC
From: RPH0470@tntech.EDU
Message-ID: <01GYTPDGRE1EJVFZ6G@tntech.edu>
Source record: 280712

I just got some new info from Harding Energy Systems, makers of the nickel-hydride cells; among other things, their address has changed. The new address is:

Harding Energy Systems
One Energy Center
Norton Shores, MI 49441-5629
phone (616) 798-7033
fax (616) 798-7044

Mail sent to the old address in Grand Haven, MI will be returned by the post office, as my first order was. My apologies to anyone who sent an order to the address I posted before. As Maxwell Smart used to say..."Sorry about that, Chief!" ;-)

Now, a little more info. Someone had asked about problems with overcharging NiMH cells. According to Harding's literature, the recommended charge rate is C/10, where C is the capacity of the cell in mAh. This rate is safe for continuous charging without damage. Higher rates can be used; Harding says any rate up to C/5 is OK without reservation, and they hint at use of rates up to C/1. The problem with overcharging at high currents, as I had surmised before, is that the high internal resistance of the NiMH cells causes the generation of excessive heat. This heat causes a rise in pressure in the cell, which opens the safety vent and discharges hydrogen gas. Hydrogen is the storage medium for the cell; as it is lost, the cell's capacity is reduced. But to recapitulate, at lower charge rates, this is not a problem and the cells can be charged continuously without worry.

The question was raised about auto-shutoff fast chargers. Harding recommends two possible charger types, the design of which is left as an exercise for the student. ;-) The first is a temperature-controlled device, switching off at either a constant temperature of 35-45 degrees C or a change in temperature of 10 degrees C. (This is a good place to note that the NiMH's we're using at work seem to get no hotter than nicads on a ~150 mA charge. We use a Rat Shack fast charger, which runs for 5 hours and shuts down; we just run the NiMH's through it twice.) The other approach is by voltage control; Harding gives no specifics on this in their literature, but they will apparently explain it to those truly interested.

Harding makes an additional cell size I had not seen before, which may be of some use: the A cell. This is 49.5 mm long by 16.5 mm dia.--compare AA cells at 50.5 mm long by 14 mm diameter. The A cell has a capacity of 1800 mAh, and a recommended C/10 charge rate of 180 mA. It may fit into loosely designed AA packs; measure yours carefully if you're interested. Harding also sells the AA and C cells I had mentioned earlier.

Hope this is helpful to those of you interested in the NiMH cells, and once again, sorry for the bad address last time.

Disclaimer, once again: I'm not an employee of Harding, just a customer.

Well, this Boteler guy was half-right.

While two HTX-202 users were conversing on my repeater
while I was working on it this weekend, I quickly switched
it into PL mode. The users were both transmitting PL.

Apparently the radio continues to transmit PL during what I
described as the Chicken Burst period. I don't know why it
does this, but my inference that it was no longer transmitting
PL is probably wrong. I must conduct further tests with
an HTX-202 in hand to see for sure.

Also, I have since been told that these radios were designed
in-house by Tandy, not by ICOM as I assumed.

Paul... tnx for this info. I'll give it a try and see if that gets a reply any quicker. What I'll also do is make the same suggestion in the text file that instructs our AOL users to do the same.

Again... tnx.

3388. Warning! FT5200 DANGER!

Newsgroup: rec.radio.amateur.misc
Date: 1993-05-31 23:55:17 UTC
From: kenh@w8hd.org
Message-ID: <1993May31.235517.20113@w8hd.org>
Source record: 280714

To anyone with a Yaesu FT5200 with the 'wireless' mike option:

DO NOT, *REPEAT*, DO NOT leave your radio on an unattended with this option installed.....any 49 MHz transmission in it's vicinity will be dutifully repeated through the radio and onto the air that is selected on the left frequency display.

I discovered it the hard way: Car in the driveway, radio on. Me inside, on my cordless AT&T phone. Entire conversation (at least MY SIDE OF IT) was retransmitted over the local regional repeater for all to hear. And, it was not a conversation I'm particularily pleased with public reception of.

Beware!

3389. Marine Band Channel 16 Freq?

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-01 00:28:41 UTC
From: miles@emx.cc.utexas.edu
Message-ID: <9306010028.AA18983@emx.cc.utexas.edu>

I think that channel 16 on marine VHF radios is the one for emergency use.
Does anyone in Greater Netland know the frequency?

Thanks to Scott Dorsey, a fine person in spite of being an Aggie ;-), who
let me know that marine channels start with #1 on 156.05 MHz, and increase
by 50 KHz per channel. That puts channel 16 on 156.80 MHz.

Hi,

A few months ago, someone with an Alinco DJ580 said that the numbers on
his keypad were starting to wear out.

Someone suggested to use clear nail polish over the keys - has anyone
tried this yet?? Any comments about it??

Thanks, ,,

3392. Toshiba T1100 laptop computer - SERIAL BOARD needed for PACKET

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-01 01:58:11 UTC
From: trasmuss@hertz.elee.calpoly.edu
Message-ID: <1993Jun01.015811.143585@zeus.calpoly.edu>
Source record: 280716

I have a TOSHIBA T1100 laptop computer and need a SERIAL PORT for it so
I can use it for PACKET RADIO. (This is a T1100, not a T1100 plus.)
It has room for an internal serial/modem board. I tried calling Toshiba
directly, but they no longer make accessories for the T1100 and couldn't
direct me to a source for one.

-- If you have a serial board for a T1100 that you are willing to sell, I
would very much appreciate it. (A modem board may possibly work)

-- If you know of any possible sources for a T1100 serial board,
please let me know!

-- For that matter, if a schematic could be provided, I may consider
building my own serial interface as a last resort.

-- The unit does have a parallel port. Is there any Packet TNC that will
work on a PC parallel port? This may be a solution.

Please e-mail responses to:

>just don't do the job they want.
>

Most HT modifications to enable wideband coverage only affect the microprocessor, not the front end. The wideband front end is already present in the radio, and allowing the microprocessor to accept a wider range of frequency entries by clipping a wire, removing a diode, etc. does not increase the radio's susceptibilty to intermod/spurious signals. What you need is an HT with a tight front end that's designed not to pass the out-of-band signals in the first place.

3395. GAP SWR Chart

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-01 04:05:42 UTC
From: martinbw@jackatak.raider.net
Message-ID: <8J7F5B2w165w@jackatak.raider.net>
Source record: 280633

For those interested in some SWR readings on the GAP antenna
here is a chart I made up that shows SWR readings when I placed
the antenna at different places around my house. I did not want
to ground mount the antenna in the middle of the yard where it
is a pain to mow around and the neighborhood kids play. Ideally
I wanted it mounted to my back deck where I could keep an eye
on it and it would be out of the way. As the 2nd column of SWR
figures showes the antenna was probably mutually coupled with
my downspout about 15 ft. away. The instructions say to test
the antenna on the ground (1st SWR Column) in the open before
mounting it on the roof or elsewhere. I get good result by
mounting the antenna on the ground on the side of the house (3rd Column).
This location gets the antenna at about the same hight as the
deck mounting and no apparent mutual coupling. The last column
measures SWR at the antenna. GAP specifies that the feedline
should be at least 65 ft. The three 25 ft. counterpoise are
easy to deal with and are only needed for 80 & 40 meters.
While the antenna is rated for 2, 6, 10, 12, 15, 20, 40 &
130 KHz on 80 meters; it is also resonant at other frequencies.

From: martinbw@jackatak.raider.net
Message-ID: <yN7F5B3w165w@jackatak.raider.net>
Source record: 280635

I am trying to seal up a couple of PL-259 connectors. I am using
a tube of General Electric Silicon Dielectric Compound. The label
specifies that it was manufactured 11/81 and has a 36 month shelf
life. Is anybody familiar with this stuff and knows what happens
when it is this old? Is it usable? Does it just not harden when
it is this old? What I have does not harden and just acts like
a silicon grease. It seems to work okay.

Hey, this gives a whole new meaning to the phrase "phone patch"! ;-)

Scary! This sounds like a real risk (and design flaw) in the radio.
And as you drive around the neighborhood, you get a bit of everyone's
cordless conversation on the air...

49MHz is not a good choice for the mike freq if no encoding scheme is used
to prevent other unintentional transmitters from doing this. What does the
Yaesu manual say about this bug?

3401. Re: Marine Band Channel 16 Freq?

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-01 07:15:00 UTC
From: bennett@erich.triumf.ca
Message-ID: <31MAY199323155237@erich.triumf.ca>
Source record: 280720

In article <9306010028.AA18983@emx.cc.utexas.edu>, miles@emx.cc.utexas.edu (Miles Abernathy) writes...
>I think that channel 16 on marine VHF radios is the one for emergency use.
>Does anyone in Greater Netland know the frequency?
>= = = = = = = = = = = = = = = = = = = =
> _ Miles Abernathy, N5KOB =
> | |__ miles@emx.cc.utexas.edu =
>_| | POB 7580, Austin TX 78713 =
>\ * / University of Texas @ Austin =
> \/ tel. (512) 471-6521 =
>= = = = = = = = = = = = = = = = = = = =
>

Channel 16 is indeed the distress and calling channel. The frequency is 156.800 MHz.

Ship transmit frequencies are as follows:
channel 01 - 28 at 50 KHz steps starting at 156.050 MHz.
channel 60 - 88 also at 50 KHz steps, between the first group, starting at 156.025 MHz. (channels 75 and 76 are not used)

For duplex channels, the shore transmit frequency is 4.6 MHz higher than the ship tx.

RGS%gms@gfimda.UUCP (Robert G. Schaffrath) writes:
>I ever checked into about this was the commercial equivalent of the Yaesu
>FT-470. It had no direct frequency entry, displayed channels instead of
>frequencies, but was essentially the same radio.

I had my previous FT-23 (Japanese version) mod to display both Ch. and freq.
by a button switch, and it does have a commercial version, with diff. labels
on buttons. Many many radios now have commercial, marine, amateur, etc
versions, with similar design, etc.

Message-ID: <C7xo65.Hpv@rahul.net>
Source record: 280726

Yow, I would hope that next time they might put something more clever
in it, but you're right, it's just a carrier-squelch gizmo.

The Japanese version of the wireless mic operates on 75.0 MHz, a
very unpopular frequency here for unlicensed low power things like
cordless phones.

Only trouble is, when I key the wireless mic, the airplane going overhead
lowers its landing gear and starts looking for the end of the runway.

Wonder how they get away with it in Japan.

>list was $5-$7 for the 9V. About 1/3 of them are dead right out of the
>pack... mfgr defect?

Not surprisingly for such a new technology product (rather new). BTW,
what happened to the rechargeable Lithium advertised and reviewed on QST
a few years ago? There was even a capacitance meter (based on voltage)
on a Icom compatible case filled with those cells. I have been waiting
for more of those around, and now NiMH is even out, but that?.....
I read that it was developed in Canada, may be the company ran out of
R&D money before anything happened, just guessing, by the way high tech
industry looks in Canada :(. (out of topic, stop soap box, cut off :).

>--ghg

Oh, yes, I have a keen interest in batteries knowledge, even my chemistry
background is rather weak. That's why I am keeping this thread.

Regards,
David

3405. Re: IC 271/471 vs IC 275/475 Performance Question

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-01 10:07:18 UTC
From: dstock@hpqmoca.sqf.hp.com
Message-ID: <C7xtG7.FL@hpqmoea.sqf.hp.com>
Source record: 280578

Zack, the old RSGB "Buyer's guide" book is worth its weight in gold. It gives a knowledgeable view of most of the radios now on the second hand market, and has a decent section on radio performance, its interpretation and measurement. Angus Mackenzie, the author is a highly respected independant consultant with a reputation for smelling a specially tweaked review sample a mile away. He has used the Mutek boards in his own personal radios and is aware of the need to set things up properly, and the sort of results to be expected. There are some reviewers I would not trust to point out a bad product, probably from fear of loss of advertising revenue, there are some reviewers I would not trust because of lack of technical competance, but Angus is one of the best I've ever come across.

Mutek was started by Chris Bartram, but is now under different ownership, sticking closely to Chris' standards. His complete front end boards were based on diode ring mixers and hermetic TR relays. It is an indictment of the radio manufacturers that such improvements could be made quite easily. Most of his preamps were BF981 based. Chris was one of the few with the knowledge to plan the use of gain and to not jump on the GaAs bandwagon while the available silicon devices had an overall performance advantage.

The preferred setup on these shores for a 2m moonbouncer with a small (in EME terms :-) array of say 4 long boom yagis would be a Mutek masthead preamp into a Mutek transverter and a decent HF rig. A Mutek front end in one of the full size 2m multimodes would be a second best preference. To get such general recognition from the group of people who are doing things that make even slight differences show is impressive.

These things are really the toys of the weak-signal folk, anyone who wants to leave a packet station running probably isn't so critical of noise factor and dynamic range. Lack of moving parts is likely a better criterion. If you want to hammer away on packet, AND do weak signal work, I think you have use for two different radios.

Hope this helps a bit, if no-one beats me to it, I'll dig out an address,

Cheers
David

3406. Amateur Radio Elmers List Info and Administrivia

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-01 11:00:08 UTC
From: pschleck@unomaha.edu
Message-ID: <radio/ham-radio/elmers/admin-1-738932404@unomaha.edu>
Source record: 280579
Cross-posted to: rec.radio.amateur.misc,rec.radio.info,rec.answers,news.answers

Posted-By: auto-faq 2.4
Archive-name: radio/ham-radio/elmers/admin
Revision: 1.4 04/25/93 23:02:45
Changes: pit-manager.mit.edu is now rtfm.mit.edu

This administrivia file and the companion Amateur Radio Elmers Resource Directory are intended for non-commercial distribution via Usenet. Any other uses, please E-mail for permission.

A Brief Historical Overview:
++++++++++++++++++++++++++

If there is any one constant in the changing state of the communications art, it is that "Hams" (Amateur Radio Operators) have always been on the forefront of it. Rumors abound where the term "Ham" came from. Some of the more amusing are described at the end of this article.

Regardless of origin of the name, a "Ham" is universally recognizable as one who experiments in radio and communications.

Whether it be constructing a low-power CW radio with vacuum tubes, or designing TCP/IP packet networks, such experimentation has historically spilled over into the mainstream such as was the case with Edwin Armstrong, who developed the regenerative oscillator and FM radio, or General Curtis LeMay (W6EZV) who was instrumental in making Single-Sideband the communications standard for the Strategic Air Command (1947-1992, now reorganized into a joint command called StratComm) and eventually the U.S. Air Force. Although packet-switching techniques originated from DARPA (Defense Advanced Research Projects Agency) and the ARPANet, no one can deny the tremendous influence that amateurs have had in demonstrating the viability of TCP/IP and AX.25 communications via radio links. The efforts of AMSAT (the Amateur Satellite Corporation), including the development of many ham satellites and the low-orbiting Microsats (communications satellites no bigger than a breadbox that use store-and forward packet techniques), have certainly advanced the state-of-the-art in communications, one of the defined purposes of the Amateur Radio Service, as recognized by international treaty.

Since in many cases hams are writing "the book", there is often no "book" or other established reference for a beginner to refer to. Traditionally, information has been passed on from ham to ham via word-of-mouth. Like many of the traditional crafts, a variation of the Master-Apprentice system has emerged, the Elmer-Novice relationship. Called "Elmers" because they are usually older and wiser, having the

benefit of many years in the hobby, including several failed projects, and an electric shock or two, they have traditionally been the mainstay of amateur radio, and the source of many new hams, particularly those interested in working on emerging technologies.

Even more importantly, Elmers provided an outlet for the impatient newcomer who wanted "to know everything, and right away." Faced with such a request, a good Elmer will smile and proceed to lead the novice through some project or operating experience. Several hours, days, or weeks later, the novice would have his answers, but would have earned them. Even better, the sense of accomplishment would boost the novice's confidence and nudge him or her down the road to being a model, experienced ham operator.

Many present hams feel that such an experience is missing today. In today's hustle-bustle world, the response to such natural curiosity and desire to learn is, more often than not, "I'm too busy" or "RTFM." As a result, the quality of new hams declines and the knowledge and operating habits they develop in their first formative months and years leave much to be desired. And the very same hams who claim that they "can't understand the new generation" also, in almost the same breath, lament about the "decline of amateur radio."

What is an Elmer today?
++++++++++++++++++++++

An Elmer today is of any age, male or female, who has some expertise and is willing to share it with beginners. Elmers don't even need to be licensed amateurs, just people with knowledge in some area of electronics or communications technology.

What is a Usenet Elmer?
++++++++++++++++++++++

With the ever-widening scope of the Internet, and the amateur radio newsgroups on Usenet, the potential for Elmers to share their knowledge to a wide audience has never been greater. To that end, I have started to maintain a list of such Elmers. Volunteers need only send me their name, E-mail address, and area of expertise. I have set up an administrivia mailbox for this purpose (elmers-request@unomaha.edu, the default Reply-To: of this message).

Those desiring a more extensive list, or who need more specific assistance, are encouraged to contact Rosalie White, WA1STO, Educational Services Manager at the American Radio Relay League, 225 Main St., Newington, CT 06111 or via electronic mail addressed to rwhite@arrl.org.

How may I obtain the latest copy of the Elmers List?
++

There are currently 4 ways of obtaining the Elmers List. Any site at least reachable by Internet E-mail can use options 3 or 4:

1. Usenet News: The latest copy of the list can be found in the companion posting to this message, "Amateur Radio Elmers Resource Directory." Since the list is cross-posted to rec.radio.amateur.misc, rec.radio.info, rec.answers, and news.answers on the 1st of each month, with an expiration date 6 weeks into the future, there should always be a copy available at most news sites. Check your newsreader documentation for information about reading previously-read articles.

2. Anonymous FTP: If your site is directly connected to the Internet, you may retrieve the latest copy via File Transfer Protocol (FTP) from the following sites:

ftp.cs.buffalo.edu /pub/ham-radio/elmers*
rtfm.mit.edu /pub/usenet/news.answers/radio/ham-radio/elmers/*

3. Mailing-List: Since the list is cross-posted to rec.radio.info, the latest copy may be obtained from the mailing-list gateway for that newsgroup (along with many other informational articles about radio) when it is published each month. To subscribe, send E-mail to:

listserv@ucsd.edu

and in the BODY (not the Subject) of the message, write:

subscribe radio-info

The server may not be able to determine your return address. In that case write:

subscribe radio-info (your E-mail address)

You should get an acknowledgement very shortly.

4. Mail-Server: If you don't want to read through the entire gateway of rec.radio.info, or want a copy of the list right away, send E-mail to:

mail-server@rtfm.mit.edu

and in the BODY (not the Subject) of the message, write:

send usenet/news.answers/radio/ham-radio/elmers/admin
send usenet/news.answers/radio/ham-radio/elmers/list
send usenet/news.answers/radio/ham-radio/elmers/diff

and the latest copy of the list should be sent to you E-mail within 24 hours (the mail-server uses batch priority to reduce system demand).

How may I contribute to the Elmers List?
++++++++++++++++++++++++++++++++++++++

By using this resource, you are benefitting the net by obtaining assistance in the fastest and most efficient way possible. By volunteering to appear on this list, you are contributing to the good reputation of the radio-related newsgroups.

Thanks to all the volunteer Elmers, as well as courteous list users, for making this service a success.

--
73, Paul W. Schleck, KD3FU

pschleck@unomaha.edu (personal mail)
elmers-request@unomaha.edu (Elmers List administrivia)

* Possible origins of the word HAM:

The acronym "Home Amateur Mechanic" or...

from the Cockney pronunciation of "L'amateur" or...

the initials of the founder of the American Radio Relay League, Hiram Maxim, W1AW (his actual middle name being Percy apparently notwithstanding) or...

from the call letters of one of the first amateur stations at Harvard, H.A.M. (please, no flames from W1XM at MIT)

Dale Mosby, N7PEX, offers the explanation that HAM must stand for "Hardly Any Money," considering the investment one could make in the hobby.

Knowledgeable individuals from the American Radio Relay League (ARRL), and other radio historians, seem to agree that the terms "Ham" and "Lid" (an inept operator) both originated with landline telegraphy. A "Ham" was a show-off and a "Lid" was a telegraph operator so inexperienced, he had to use a pot or can lid to rest his telegraph sounder on to properly copy the code.

As an interesting historical footnote, early telegraph operators may have been the first to experience the infamous curse of our communications age, Repetitive Stress (or "Carpal Tunnel") Syndrome (called "Glass Arm" in those days, which encouraged the invention of the semi-automatic or "bug" key).

(Larry E. McDonald, N6ZMB, wrote to point out another plausible origin, which doesn't necessarily contradict the ARRL version. The term "ham" may have been derived from "ham-fisted" or "ham-handed" to describe poor telegraph operators who were hired from the ranks of radio operators. Or maybe "ham-fisted" and "ham-handed" are derived from "ham." Who knows?)

Jeff Angus WA6FWI

jangus@skyld.tele.com

I run NOS as a tcp/ip <--> AX.25 mail bbs gateway. I also run a few nodes,
soon to replace with Tnet-x1g on one and a PC NOS-switch on the other.
And, I have successfully installed UUPC/extended 1.11k and SNEWS for those
MS-DOS afficionados out there.

ampr.org IP Coordinator for California - Los Angeles and San Fernando
Valley subnet (44.016.xxx.xxx)

"We're here to help, we don't loan tools" (Just kidding....put me on the
list). Monday-Thursday 8 AM to 9 PM Pacific time, Friday 8 am to 5 pm.

--

Jay Appell --> KA1SNA

1976-1978 FCC Personal Users Radio Advisory Committee
Task force for Rules Rewrite Citizens Radio Service
Rules interpretation

Currently work for Stratus Computers/Technical Support Engineering

Address: Jay_Appell@cac.stratus.com
Telephone: 1-800-458-0042 X2548

I enjoy Amtor, RTTY, and SCA reception.

If you would like to leave me mail by modem, use the BBS 1 Hopedale Center at 508-478-6969. This is a new amateur BBS running from 7AM to 7PM EDST. The board usually runs beyond 9PM daily. Until I can get another server, online times will vary. We honor modems running 9600 baud/MNP 5.

Discussion groups have been setup for all ham radio vendors. Comments shared on this BBS will be conveyed to the ham radio company referenced in the forum. This platform will make companies aware of how the amateur radio community feels about their products. Please indicate otherwise if you don't want the comment forwarded.

Author of the following MS-DOS ham programs:

AutoExam - Examination simulator and study aid
AutoCW - Morse Code practice program
DOSGATE - allows users to run programs on your PC remotely (AutoExam
compatible)
AutoCall - Allows use of the Buckmaster HAMCALL CD-ROM online callbook
with DOSGATE
AutoFax - Allows reception of weather fax using Kantronics TNC's
SeeSats - Real time satellite tracking (text only), DOSGATE compatible

Most of these programs are available from wuarchive.wustl.edu under
/mirrors/msdos/hamradio or write me at:

7 Red Field Circle
Derry, NH 03038

and enclose:

A FORMATTED high density diskette (either 1.44 MB or 1.2 MB; 3.5" or 5.25").
A Self Addressed STAMPED return diskette mailer.
A note explaining that you want a copy of AutoExam and/or AutoCW
(or one of the other programs).

I am always receptive to individuals interested in maintenance,
enhancements, and non-commercial distribution for these shareware
programs.

Amiga 1000, WB 1.3 | INTERNET: salnick@DejaVu.spk.wa.us
WA9BVE |

I can help people with HF stuff, cheap antennas, and am willing to help
troubleshoot problems with rigs.

I believe that one of the pillars of ham radio - construction/
understanding at the burn-your-hand-with-a-soldering-iron level - is
drifting out of ham radio. With Japanese radios which cost so much,
fewer and fewer hams are willing to risk their warranty to service their
own equipment. I would like to see a turn-around here...

I dont remember seeing any mention in the ads in QST,73 or CQ that
a ham radio license is required. AEA and universial AR catalogs
dont mention this either. How about ads for ford,chevy, honda. They
dont mention the fact that you need a drivers license to make use of
their product.

3410. Help. Magnetic loop antennas

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-01 11:41:05 UTC
From: rjc@crosfield.co.uk
Message-ID: <1993Jun1.114105.4905@crosfield.co.uk>
Source record: 280583

Hi,

I want to setup my HF station at my new address, but I've only got a
small garden (40 feet) and I don't want to upset my new neighbours, so
I magnetic loop antenna seems a good idea for 80 and 40.

There seem to be several firms selling magnetic loops of various varieties,
and I'm not sure what to go for or whether they work very well or not.

Has anyone any experience of these types of antennas that they could enlighten
me with ?

Thanks in advance

Roger Clark G4KYF

3411. Morse Code for the Mac

--
It seems that the major manufacturers (Alinco, ICOM, Yaesu, Kenwood...) must
believe that hams want scanner features - since they are putting them in and

they are selling. The first manufacturer who squeezes in a few more features such as 100 channels in 10 banks of 10, triple conversion and a scan rate of at least 20 ch/sec will have a 'best seller' on their hands. The intermod should be greatly reduced by triple conversion. I suppose that these features will take a little more space but it would be well worth it for many.

I agree that the ideal solution currently is to have both - but I don't want to haul around two radios, especially on travel. Many cannot afford both right now. Bye...

3415. Computer interface format for Kenwood

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-01 13:43:12 UTC
From: turini@gdls.com
Message-ID: <1ufmdg$d1q@gdls.gdls.com>
Source record: 280587

I purchased a Kenwood TS50s last Friday and noticed that it had a computer interface plug on the bottom. The manual has absolutely no information about it, except to mention it.

Has anyone connected a computer to this interface and programmed the computer to control the radio?, what is the protocol?, any printed references? etc..

Inquiring minds want to know!

I assume that the safest way to interface a computer to the radio is via the Kenwood interface. I'm off to buy it, perhaps it will contain some information.

Thanks for any replies.

--
Yes - but the ads in QST, CQ and 73 are TARGETTED for hams since most
subscribers are hams. The J.C. Whitney catalog is TARGETTED for the auto
enthusiast many of which are CBers. Joe CBer sees the ad and will figure
that it must some new CB, and just look at all those channels! Bye...

3417. Ham exemption threatened..Re: More info on Minnesota scanner law

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-01 14:22:52 UTC
From: whs70@dancer.cc.bellcore.com
Message-ID: <1993Jun1.142252.20537@porthos.cc.bellcore.com>
Source record: 280590

This has been posted in rec.radio.amateur.policy, but I'm posting it to the main newsgroup (rec,radio.amateur.misc) to help enlist the support and awareness of all US hams, and especially those that live in Minnesota.

**PLEASE - Direct all responses only to the rec.radio.amateur.policy newsgroup.

In article <1993Jun1.124557.29447@rsg1.er.usgs.gov> tbodoh@resdgs1.er.usgs.gov (Tom Bodoh) writes:
I posted on Friday about the proposed revision to the Minnesota scanner law which would eliminate the exemption for Amateurs. Following is the name, address and phone number of the author of the ammendment;

Mike Delmont
#307 State Office Building
St. Paul, MN 55155
(612) 296-4226

I would be interested if anybody contacts him - to see why he dislikes hams - couldn't he pass the code test? Should somebody tell him about the no-code tech license? What is his problem anyway? Perhaps he thinks that scanner enthusiasts will get their ham ticket just to avoid the law? BTW - his name and number are in the June issue of Monitoring Times. Sorry I don't have his home number to give you ;-)

BTW - I do urge anyone that contacts him not to be irate, obnoxious or obscene. He apparently already holds a negative view of hams - lets not verify it for him. Since this affects Minnesota hams the most, I urge any of them who receive this to try to meet with him and work something out. There must be some compromise - as most mobile 2 M/70 CM rigs would qualify as scanners.

|>

I used to travel frequently from Atlanta to UGA (Athens). Based on the average
speed I drove and the speed of all the cars passing me, I wouldn't have thought
any police used RADAR in GA.

Except in one little burg I used to drive thru. The name was always good for
a laugh too. Between, GA.

"Honey, I got stopped by the State Police for speeding in Between."
"In-between what, dear??"
:-)

I kinda miss my trips to GA now.

The relay they use is a fast sealed type. I don't know the exact
switching time, but subjectively I'd say the relay is *faster*.

>What is the active device used on the Mutek mixer?

It's a Mini Circuits double balanced mixer, a sort of diode ring jobbie
with a high third order intercept.

>but they will apparently explain it to those truly interested.
>

Maxim makes a couple of chips, the MAX712/713, that should make a charger
as described above pretty easy. I don't remember which is which, but one
goes from fast- to trickle-charge due to temp changes and the other due to
voltage. Actually, I think they monitor the rate of change of these
properties.

I've got some tech notes around here somewhere, if anyone is interested
e-mail me. They describe chargers for both NiCD and NiMH celss (from 1 to
16 cells at a time).

3423. Two-fer troubles

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-01 17:10:39 UTC
From: awinterb@du.edu
Message-ID: <C7yD1s.Ip@du.edu>
Source record: 280595

I am experimenting with the latest evolution of the Two-fer, 2.5 watt transmitter, as described in the April issue of 73 mag but am unable to achieve the 2+ watts, getting instead less than 1/2 watt. I'm trying to use the full circuit (including the QSK piece) and am keying the oscillator on/off (not using the continuous osc. option). All of this is being done on the FAR circuit board.

Some significant variations I've done are:

* For the RFC off of the PA collector (to + voltage), used an FT50-61 toroid with 19 turns rather than the depicted FT37-61 with 21 turns.
* Used an NTE236 transistor for the PA instead of the MRF476. * Substituted a 10 ohm resistor for the 33 ohm resistor off of the emitter of driver (a 2N3866) to increase driver output.

After building a variation of the output filter for 30 meters and obtaining very low output power before and after the filter (on the order of < 1/2 watt), substituted the filter depicted in the schematic for 20 meters. However, power output was the same.

Decided to experiment with the matching transformer between the driver and the PA (T37-2 with 26 turn primary and 3 turn secondary). I used #28 wire for the primary and #26 wire for the secondary windings to make it easier to tell them apart. Here's what happened:

secondary turns current used by circuit output power

3 250 ma < 1/2 w
4 350 ma < 1/2 w
7-12 450-500 < 1/2 w

The only significant change was the increase in current used by the transmitter. The 2N3866 driver gets VERY hot (regardless of the number of secondary windings). The final PA got warm but early on placed a heat sink on it (it cost too much money).

I would be interested in finding out anyone's thoughts on why I can't squeeze any more power out of this circuit. I don't have a spec sheet on the NTE236; can any more power be expected from this transistor? (The parts store said it was a direct substitute for the MRF476.) The next thing I might do is desolder (again) the PA and measure the output of the driver directly off of the secondary of the matching transformer (the board's really getting worn out in this area so may only do as a last resort).

>That's why there ought to be a law

Here, I disagree completely. The period in the sentence should be right after the word law.

There are entirely way too many people out there who enact laws for the warm fuzzy feeling that one gets when we feel that we are doing something useful.

Remember the War on Alcohol? Well, somebody got up one morning and said, "There oughta be a law..." What about the War on Drugs? Same thing. In many states, private citizens no longer have the right to defend themselves from criminal intrusion because somebody said, "There oughta be a law..."

People are responsible for their own actions. Laws which restrict MY rights on the assumption that MY access to something MAY in some way harm somebody should never be enacted.

>Some vendors, notably Radio Shack, do this voluntarily

This should be commended but should not be mandated.

There are way too many ways for the government to come up with revenue generating schemes. Remember civil forfeiture? It was a way to strike at drug kingpins. It has been turned into an underhanded taxation scheme which strikes at those who are not politically connected.

> their product.

Beautiful logic. QST, 73, CQ are targeted at ham radio operators, who
know the license requirements. The ads for Ford, Chevy, Honda are
targeted at automobile drivers, who know the license requirements.
(For that matter, my four-year-old son knows that!)
The J. C. Whitney catalog is targeted at cool cats who like to hang
aftermarket gizmos on their cars. The chances are that at least some
of them would assume that because it is marketed through that channel,
it must be OK for them to buy and use. Practically every non-
technically-oriented person I've dealt with believes that ham radio in
general and two meters in particular is merely a high-end Citizens' Band
and is open to anyone who can afford the equipment.

The issue is not about expecting equipment vendors to bear full
responsibility for curbing unlicensed activity, but rather about not
setting bear-traps for unwitting consumers. As long as the sellers
can move the merchandise, they don't care if some ill-informed buyer
gets hit with a fine or prison term. That's why there ought to be a law
that requires them to inform the buyers of esoteric gizmos like ham rigs
that there is indeed a Federally-mandated (yea, international-treaty-
mandated) licensure requirement for both station and operator.
This would at least help keep the honest people honest.
Some vendors, notably Radio Shack, do this voluntarily (mostly as a CYA
gesture, I suspect) but the chances are that J. C. Whitney doesn't care
("What the hell, we're already in Chapter 11 anyway!")

73,
Doug K5DH

3426. Proposed Minnesota scanner law - update

Source record: 280594

--
I was the one who posted the information regarding a proposed ammendment to
the Minnesota scanner law which would remove the exemption for amateur
operators. I was just contacted by the ARRL and told that the ARRL and
the author of the bill have worked things out. Apparently the author has
talked to the author of the original scanner legislation and after that
he pulled the bill.

Please do not contact the author of the bill, Mike Delmont as he is
cooperating. Apparently this was resolved about two months ago but the
lead time in publishing the June issue of Monitoring Times along with my
own outrage led to my posting. Sorry...

BTW - I am impressed with the way the ARRL looked out for the amateur
community in this matter.

Message-ID: <50.1340.1129.0N00025C@freddy.ampr.ab.ca>
Source record: 280626

Hi John;
This is by no means complete but you should be able to recieve APT signals from NOAA 9 @ 137.620 Mhz; NOAA 10 @ 137.500Mhz; NOAA 11 @137.620 Mhz and NOAA 12 @ 137.500 Mhz. Also alvaiable is the Russian Meteor Spacecraft however I believe that most of them are inactive or are having trouble with their signals. At any rate they are Meteor 2-20 @ 137.850 Mhz Meteor 3-3 @137.300 Mhz Meteor 3-4 @137.300 Mhz.

I have heard (but not seen) that a shareware program called Traksat (2.8 or higher) can do mutli-sats at a time, I don't know who wrote it? Sorry!

Also as a note, the Book by Dr. Ralph E. Taggart, WB8DQT WEATHER SATELLITE HANDBOOK is the BEST around if you want to get into recieving APT signals. Highly Recommended!!! 4th. ed.

Good Luck to you hope I helped somewhat, if I missed anything I'm sure someone else out there can fill in the holes.

Dave

My Hewlett-Packard Paintwriter printer seems to have a spur on 146.76 MHz.
The signal seems to be there as long as the printer is plugged-in, since
it's control circuit is really only asleep when it is "off"!

I have picked up this spur on several radios, so it's not just the HTX-202.

3430. Intermod/spurious sigs a common HT problem?

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-01 18:20:59 UTC
From: PMcAfee.El_Segundo@xerox.COM
Message-ID: <"1-Jun-93.11:20:40".*.PMcAfee.El_Segundo@Xerox.com>
Source record: 280598

bodoh@dgg.cr.usgs.gov writes
"The first manufacturer who squeezes in a few more features
such as 100 channels in 10 banks of 10, triple conversion and a scan rate of
at least 20 ch/sec will have a 'best seller' on their hands. The intermod
should be greatly reduced by triple conversion. I suppose that these features
will take a little more space but it would be well worth it for many."

There seems to be a missunderstanding here. Intermod may come from a couple of sources. External generated intermod (most often at the repeater/remote site) and internal intermod generated in the receiver FRONT END ahead of the IF stages. The only thinges that will help here is bullet proof front rf-mixer stages (and lots of battery drain), narrow band width filters at the antanna input or reduced sensitivity. Front end filters will help with out-of-band intermod but not in in-band-intermod. The point here is no matter how good the IF filtering is it won`t help the intermod. The damage is already done up front.

If you cant measure it (the sideband noise) go for the following:

a vary the supply of the vco, the less insensitive to the
variation, the less noise will be there...

b supply the varicap with a low impedance (instaed of a 100 k as I have seen in some
designs, it makes it at least 10 dB worse)

c the noise impedance match is far less important as a and b.

> to that spot? Thanks

Steve-

The IC-24AT seems to have a chronic problem with low modulation. There is only a peak deviation adjustment (separate VHF and UHF adjustments), so you have to take whatever microphone gain there is after setting the peak. I believe the microphone element is located below the speaker, toward the right side. If you hold it at just the right angle, I think you can see the opening.

I haven't completely given up on mine. It came with peak deviation set for about 3.5 KHz, and less than 1 KHz average modulation when speaking within 1/2 inch of the microphone in a normal voice. The VHF side was adjusted to about 4.5 KHz by the AES technician, but he missed the UHF side. (Service manuals weren't available for about a year after the radio came out.) It is now just over 1 KHz average deviation on VHF.

I believe that by adjusting peak deviation with PL turned ON, for exactly 5.0 KHz, and speaking very close to the microphone, that we may get usable audio.

I corresponded via E-mail with an Icom person, who indicated that the design was deliberately done that way, because of complaints of high background noise on earlier radios. I find this hard to believe, and think they just don't want to admit liability for a mistake. He stated that it might be possible to increase microphone gain by changing some components, but that there is no Icom service note or bulletin telling how to do it.

After using the IC-2AT for many years, the IC-24AT has been quite a disappointment. This experience plus Icom's attitude, make me believe they are no longer producing dependable equipment. Now that Radio Shack has announced that their new handheld will not be the rumored dual-band, I'm looking toward Kenwood or Alinco for a replacement radio.

Review of QRZ! Ham Radio CD-ROM

Fred Lloyd, AA7BQ, and a cast of contributing others has producted a
CD-ROM with 500+ Mb of amateur radio related data, information and software.
For those that missed the origional announcements here's a summary of whats
on the disk:

* ISO 9660 CD-ROM Format - readable on all systems
* March 1993 US CALLSIGN DATABASE (in ASCII)
* PC (MSDOS) compatible search and retrieval software
Search by callsign, name, city, zipcode, several
output formats including screen, mailing lists, etc.
* Hundreds of popular ham related (shareware) programs
* Nearly 200 radio and scanner modifications
* USENET news articles from rec.ham-radio and
rec.radio.amateur.{misc,packet,policy} since 1989
* Complete dumps of several internet ham radio archives
* Canadian and US CLUB callsigns (no search/retreival software)
* FCC Rules and Regulations (Part 97)
* DX lists, DXCC info, BBS Lists
* UNIX callsign database/server 'C' source code
* SIMTEL20 Ham Radio Archive Files
* Vast amounts of useful reading information for the radio amateur

The QRZ callsign search and retrieval software is very good. The performance
of looking up a single callsign is simply 'how fast can you get your finger
off the return key'!

The other lookup modes 'effectively' search the entire database, all 597,071
amateurs. For each search criteria (callsign, name city, zipcode) there is
a corresponding database and index file optimized for a given search criteria.
The performance here is nothing short of amazing. For example, on my 40MHz
386 PC a search for all the amateurs with the last name of 'Cranston' takes
about 15 seconds!

All of the callsign functionality can run directly from the CD-ROM, you
need NO hard disk space for this. However, if you need the ultimate in
performance and you have more hard disk space than you know what to do
with, you can copy all 200Mb or so of the QRZ files off of the CD-ROM onto
your hard disk!

The Usenet news article archives contain a wealth of information and
entertainment (you can re-live the No Code wars).

The infomation supplied by Devon Bowen, KA2NRC from buffalo.edu (\BUFFALO) is an excellent reference to various aspects of amateur radio. From the amateur radio Frequently Asked Questions (FAQ) notes (FAQ_HAM.1, FAQ_HAM.2, FAQ_HAM.3) to WEFAX (WEFAX.TXT). These files contain good solid, yet basic, infomation and pointers to sources of more info and parts, kits and equipment. Also include here are the Canadian and US CLUB callsign lists (CANADIAN., CLUBCALL.)... no search/retreival software is provided for these. The US CLUB callsign file appears to be the same format as the UNIX flavor of the QRZ database (see stuff in \UNIX). The Canadian callsign file is a different, but simular format.

The amateur radio and scanner modifications (\MODS) probably covers all the known to man kind mods that you can make. Alinco, Icom, Kenwood, Uniden, Yaesu HF, VHF, handheld radios; Radio Shack and Unden base and handheld scanners.

Software... there is tons of freeware and shareware amateur radio related software on the CD-ROM. Most of it is for MS-DOS (some Windows). There is some Macintosh and Amiga software (KA9Q TCP/IP). The software ranges from logging programs, packet terminal programs, the NEC antenna modeling software, FAX, SSTV, RTTY, CW learning, propgation, satellite tracking, too many to list here, Beleave me, its more than likely there if you want it!

The QST/QEX bibliographies and indices are very nice references that you can search (use the DOS find command, or get the Unix tools from MIX Software, Inc for $20 and use grep and others).

The only product to compair this CD-ROM to is the Buckmaster HamCall CD-ROM. HamCall costs twice that of QRZ! ($50). HamCall by now should have released an update that is from the March FCC callsign records. The HamCall CD-ROM also contains tons of software, alot of it being non amateur radio related. HamCall has little to none of the other data and info available on QRZ! (such as, bibliographies, Modifications, Usenet newsgroup archives, etc). The HamCall callsign database is also NOT in plain ascii text and its slower than that of QRZ. The HamCAll CD-ROM is update qualterly (I could be wrong about this?), but you pay the full price to get it.

It is not known at this time when any updates to QRZ! will be made. In the 00READ.ME file Fred Lloyd indicates that there will be a next edition.

If you want more info about this CD-ROM, you can anonymous ftp the readme and index from cdrom.com:/pub/cdroms/ham.

In a nutshell, the QRZ! CD-ROM is a gold mine of amateur radio stuff, at a price that can't be beat!

The QRZ! CD-ROM is available from a couple of sources:

Walnut Creek CDROM
1547 Palos Verdes Mall, Suite 260
Walnut Creek, CA 94596

1 800 786-9907
1 510 674-0821 FAX
orders@cdrom.com

Price: $25 plus 5$ S&H is $5 for US/Canada/Mexico, $10 for overseas.

(This one was recently posted to the news group, I assume the pricing
is valid)

Media Innovations
5405 Alton Parkway, Suite 504
Irvine, CA 92714
714-831-1121

Price: $15 each plus $4.50 S&H

Here's a look at the directory tree of the QRZ! CD-ROM:

Well, there are two lessons to be learned from this. One, never leave
the radio on in your car. Two, there's a modification for the MW-1 that
will only let the radio key up when it receives both the 49MHz signal
and an infrared command from the MW-1 remote. I think they list it in
the users manual for the MW-1. By the way, are you pleased with the way
the MW-1 works? I sent mine back after three days. It was a piece of
junk.

3438. Generate SSB using combined AM/FM?

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-01 20:48:33 UTC
From: btoback@netcom.com
Message-ID: <btobackC7yn4y.Lu@netcom.com>
Source record: 280605

In the ARRL publication "Solid State Design for the Radio Amateur," reference is made to generating an SSB signal by combining AM and FM: "...it may be shown mathematically that a carrier which is amplitude modulated properly and frequency modulated simultaneously will yield a single-sideband output."

Unfortunately, the text gives no references, and my nearly-vanished knowledge of trigonometric identities is apparently not adequate to derive this result. Can anyone point me at some references and/or provide more information about the technique? How should the amplitude and phase of the carrier and modulating waveforms be adjusted to yield the desired sideband?

Thanks for any help -- post here or email to btoback@netcom.com.

Perhaps the lack of a contact was more due to the inexperience of the
operators and the crude nature of the transmitting equipment, combined with
the low sunspot numbers of the time had something to do with it.

Perhaps if we had just been more persistant....

Source record: 280603

>My idea of a G5RV antenna is THE antenna invented by G5RV himself!
>Nothing else. When I hear someone referring to a G5RV, I assume that
>this is the precise antenna he is talking about. Methinks I assume
>too much. 73 de K9CUN, Jack

Jack,the mischief is that G5RV, himself, invented THE antenna and then proceeded to invent variations of the antenna. He has discussed different impedences and/or lengths of feed lines, baluns or not, coax or not, antenna tuners or not,... I have implemented G5RV's latest suggestions of using an antenna tuner with no balun and no coax. The dbi gain in each of the FOUR nodes of the G5RV is equal to the dbi gain in each of the TWO nodes of a dipole on 17 meters.

The reason that some Hams get better results from a dipole is that there is almost NO (NONE, ZILCH) broadside radiation from the 102' G5RV antenna on 17 meters, for instance. Each of its four nodes is just as strong as each of the dipole's two nodes, but North/South plus/minus 50 degrees for a North/South antenna. In my opinion, it can't be beat for $25 cost.

> is common?? cul
>
I don't know about normal, but mine does it too. So does a friends. It
is not picking up an external signal. BTW, it only is observed when the
rubber ducky is used, ie when an external antenna is used, it goes away,
so it seems to be an oscillation involving reactive components in the
rubber ducky! It goes away if you hold your hand near the antenna too,
but so does the reception of distant signals.

3445. Re: Alinco DJ-580 question

> I didn't notice problems there, you're not likely to notice them anywhere! :)

Wow. There must be a lot of variability in the radios Alinco turns out.
My '580 is extremely sensitive to intermod etc. particularly on the VHF
side. I don't *think* that the mod does anything but enable, but don't
know for sure. Anybody else *know* exactly what clipping the little
wires actually does?

Hah! Depending on the local 'repeater political' situation, it might be easier to arrange for Commodore to re-design the Amiga to eliminate the spur.

I would like to mount a beam/quad using my chimney. The chimney has reinforced steel bars in it and was recently redone from the roof up because of the 89 earthquake.

Where can I find a good chimney strap mount. The radio shack one does not look strong enought to hold a 30 lb. beam or quad. I was told to use two steel plates, one on each side of the chimney, held together with large bolts, to support the mast. Where can I find such a thing? Or who can make one for me. This sounds like a better idea than a roof mounted tower.

Well, I don't know about the ones mentioned in QST, but I have a datasheet here from Panasonic that lists two different chemistries of "Lithium Rechargable Batteries". Unluckily both are only available in "coin" cells, with the largest capacity of 100 mAhr (won't last long in an HT putting out 2.5W! ;-). One advantage listed for the Vanadium Pentoxide cells is "Self discharge rate less than 2%/yr."

As a side light, my Panasonic Camcorder has some sort of a rechargable Li cell in it to run the clock/calendar for the time stamp. I remember reading in the directions (yes, I do read such things... I've put enough effort into writing such things that I'll at least give the person who wrote it enough respect to read his words, though I won't necessarily heed them) that you needed to keep the lead-acid battery charged and in the machine for the first few _days_ so that the lithium cell could be fully charged.

73,
Clark

I know a guy here in Colorado who beat a ticket that was taken
using an airplane spotter (I presume this is the same - a guy
in an airplane times you as you pass between the markings are
on the pavement). My friend succeeded by pointing out to the
Judge the possibility for error in timing: i.e. if the guy in
the plane started the stop watch a second late and stopped it
a second early the indicated speed would be off by more than
he was speeding, which wasn't much.

They do offer a jumper option making reception of the IR *and* the 49 MHz
necessary for mike operation...but it does not come this way.

: Sometimes it is, sometimes it isn't. It can depend on whether the receiver
: uses a noiseless squelch system or gives a crash on carrier loss. With
: noiseless squelch, it's often difficult to tell whether the other operator
: has unkeyed or is merely taking a dramatic pause without some sort of beep.
: Many repeaters use a courtsey beep for this purpose, but if you're operating
: simplex, letting the transmitter beep before dropping carrier is a good
: way to simulate a verbal "over".
:

I don't know about the rest of the world, but around here several of the
repeaters (most of them) have timers, and at least a few of them are pretty
short (like 30 seconds during "rush hours", and 1 minute at other times).
If you don't wait for that "courtesy beep" to indicate that the timer has
reset, the "alligator" will get you! I'm so used to this, that I often times
catch myself "waiting for the courtesy beep" on simplex!

(Also, the repeaters are programmed so you can tell interesting things, like
whether the other person is on the repeater locally or is coming in through
the link, and whether or not the autopatch is available, just by listening
to the courtesy beep[s]. Also you can tell even whether or not the link
is up.)

: program. The ARRL BBS number is 203-666-0578.
:
: Robert de N2JTX

You can also have the ARRL's "info server" send them to you via the Internet.
Send the following three lines as the text of a message to info@arrl.org:

SEND POOL-TECH-1-NEW
SEND POOL-TECH-2-NEW
INDEX

The server will respond with three messages. The first line gets you the
first part of the question pool, and the second line gets you the rest of
it. The third line will get you a list of what the info server can send
you (the list runs to over 5 pages). Be patient, though, as the server
is not on-line all of the time, so it may take a day or two to get the
responses.

> dont mention this either.

QST, 73, CQ, and the AEA and Universal AR catalogs are pretty much addressed to the radio amateur - you can pretty much assume that those reading them have _some_ knowledge of amateur radio and the licensing requirements.

J. C. Whitney, OTOH, is in no way geared specifically for the radio amateur. You really can't make the assumption that readers are aware of the licensing requirement. And given the level of current FCC fines, it's really not fair to J. C. Whitney customers to make ham gear available to them without making it clear that a license is required for operation.

> How about ads for ford,chevy, honda. They
> dont mention the fact that you need a drivers license to make use of
> their product.

It's not real likely that their potential customers won't be aware that a driver's license is required before you drive a car. You can't make the same statement about J. C. Whitney's customer's awareness of amateur radio licensing.

Although I own a Kenwood 741, I would have to say, based on many fellow ham reports here in the Dallas-Fort Worth area, the Kenwood 732 is the winner hands down. The combination of size, power output, detachable front panel, and remote controlability (is that a word) make it tops, plus the receiver is a little more solid than the 741. The 732 wasn't out in the US when I purchased my 741.

I have some friends who have the Alinco 600, but I personally think the audio sounds a little funky on it. If I had to buy a new dual bander (and I will pretty soon) I'd get a 732.

I'm suprised they even market a "wireless mike" option like that.
The unit is acting as a repeater, but it doesn't have any of the controls
a repeater is required to have. No ID, no remote shutdown, etc.
Should the FCC be asked to yank its type approval?

Source record: 280624

Hello all,
I was at the local club meeting tonight and one of the club
members wanted to know if aynone could find his brother's old call. The
name is Bruce K. MacLean. He should be in books from late 60's and up to
73 or 74. The easy answer would be to ask him but this is impossible as
he died shortly after this time. My friend was still a little young and
not yet into amateur radio. He had either a 6 or 7 area call and was an
extra class I beleive.
E-mail or post is fine.

Thanks,
Dan

I'd think twice about the 732 if you live in a metropolitan area. A fellow ham and diehard Kenwood fan (WA7UUL) bought a 732 and couldn't receive hardly anything over the intermod. Adding the optional CTCSS chip didn't help, either. He's still not pleased and recommends *AGAINST* buying one.
[Don't look at me...I'm just passin' this on...]

Has anyone had any experiences with the Standard C5608DA? I like the layout, but was wondering if it's a good radio. Standard isn't one of the most common names I hear...

>Could you elaborate on cloning functions that are known to work on
>computers for programming handhelds ?

I'd like to but I don't know if I can still find the article, which I thought was posted here a while ago. If anyone has it, please send that again, or to him. Basically, the format is strict ASCII on a rather standard speed in a serial format, so you just need to open up the serial port by a term program, open a screen buffer, transmit the cloning feature over the mic/sp line (need cable made), then you have the file format of it, edit whatever you want, then you can download it back to the HT, with its cloning on receive, and it should have its settings changed. Anyone knows what models have this cloning features? (I thought my old FT23 has, but I forgot)>

wangsh@mhd1.moorhead.msus.EDU writes:
>I just got a very nice TH-77 from a friend, unfortuantely it is a
>Japanese version. Is there any mod for this model? I know there is one
>for TH-77A, but is it appliable to TH-77?

My TH-215 is a Japanese model, and was mod. to exactly the same functionality
as the Th-215A without any additional hardware. Plus I also have the RX and
TX extended: RX direct entry 141.000-162.995, using keyboard tricks, it
can rx 140-169.995, TX is 141-162.995 (Note: out of band transmission to
the air without additional qualification is not legal (in most countries)
and in some countries, just ownership or possession is alrealy illegal,
saying this as disclaimer, I guess :).

Back to the subject, the mod should be similar, but also possible one or
more things to change. (My ex FT23 was a Japanese version, and was mod.
also to extended freq. plus duplex op. too).

Long Eaton
Nottingham
NG10 4NQ
ENGLAND

Telephone: +44 (0)602 729467

I would agree with the lousy front end switching on the 251 and replaced
mine with relay. I like my 251 and, as others have commented, it has plenty
of space for modifications, in my case I added an auto tracking doppler
system for the sats.

I have an Icom-24AT which I would like modified for cross-band repeat, extended transmit mode, etc. Add to that I need my BNC coupling firmly held down, and possible a TNC cable between my HT and a Kamtronic KPC-3... With this in mind, and keeping in mind that I am a starving college student, is there anyone in the San Francisco Bay area, who could help me out??? If so, please e-mail me or give me a call at (415)666 5754

I've never used the internal batteries. I recently got lots of wet
Nicads (5 x 12.5V x 11 AH)--just in case I decide to run portable EME
with a TWTA. For hiking trips I use one or two 4AH Nicads, but also have
an RV battery and 15 AH gell cells. One set of Nicads holds down the
paddle and the memory keyer. A minor problem with the setup is that
even 25 wpm is a bit fast for your average VHF type, though I have
heard 30+ wpm on 10 GHz.

Depends how much work you are willing to do. There are undoubtedly
feedback configurations that will help, especially if you start
looking at multiple transistor designs. I haven't really looked
at this yet--20 dB of gain is actually about right if you are
designing a single conversion high performance *transceiver*.
What makes it tough is that even cheap GaAs FETs like the MGF 1302
have plenty of gain, even at 10 GHz. Thus, you probably have do
design it like a *microwave* circuit, to really get the best
performance. Casual design can result in the circuit *almost* working.
It might be fine 99% of the time, but it might do weird things when
hooked up to certain antennas, for instance.

>>This neglects the issue of what you really need. Sure, a noisy

This depends on the operator. I notice that I don't get an improvement
with a narrow bandwidth receiver. But, I also enjoy operating the CW
Sweepstakes with a 2 kHz wide filter. What this means is that I have

an ear trained to pick out whichever CW station I want, rather than letting the receiver do it for me. I'd guess that I can effectively narrow the bandwidth to 100 Hz.

>improvement. Now, the FT736R already has the narrow filters available.
>One thing that limits the noise floor of the transponder is the
>bandwidth it has. A 200 kHz wide receiver isn't going to have the
>NF of a narrow rig.

Actually, for a first approximation, noise figure is independent of bandwidth. This is why I guessed at the noise figure of the 251E/Mutek. The radio had an unusually narrow bandwidth--you might even say it was optimized for EME work :-). The reviewer, to his credit, picked up on this and reported the bandwidths, expecting the reader to actually read the review, and not rely on blind numbers. It could be that the new mixer is mismatching the IF filter, causing the poor filter shape.

Our approach with such problems is generally to give the manufacturer an opportunity to fix them. I suspect there is a difference in response before and after product reviews with some companies. I don't know about the UK, but such a narrow filter would be a real problem for many people. (350 Hz 3 dB BW)

I hadn't heard of Standard much until recently. They were at the Dayton
hamfest, but even then I didn't see many around.

So where did they show up? They make MARINE radios. You know, the
156 MHz band radios that are shock and water resistant? A LOT of
pretty expensive boats come with Standard's VHF Marine radios.

I'm aware of the mod, Tony, but it makes the unit quite intermittant in
normal operation.

I have a love-hate relationship with the unit...the audio stinks, but it
sure is convenient, and safer, to operate the radio while driving.

>of trigonometric identities is apparently not adequate to derive this result.
>Can anyone point me at some references and/or provide more information about
>the technique? How should the amplitude and phase of the carrier and
>modulating waveforms be adjusted to yield the desired sideband?

Consider "dividing" the phase and amplitude information into different
channels. Since filtered phase modulation can be thought of as frequency
modulation (the filtering makes the phase modulation process smooth) you
could then treat the phase channel as FM and amplify it using extremely
efficient class C,E, etc. amplifiers and at the same time heterodyne
it with carriers that are in quadrature and later remix to get `SSB' phase
modulation. The other channel, containing the amplitude information,
(detected envelope, or whatever) is amplified on a much lower efficiency,
but much less power hungry channel and then you `plate modulate' the
quadrature combined phase channels in the final amplifier with the
envelope channel to get the final product.

This quicky description of the phase channel and amplitude channel being
treated seperately is the heuristics behind "High Efficiency Linear
Amplification by Parametric Synthesis" by Karl Meinzer, DJ4ZC. It is
used in all of the `linear' transponders in AMSAT DL/NA built satellites.

Karl Meinzer once built a several kilowatt SSB amplifier that was almost
legal back in the days of power being described by DC Input.

Unfortunately, I don't have the answer to the question, but I
just HAD to point out that the velocity of light in free space
is approximately 3.0e08 meters per second, not 3.0e05. It can
be shown that this is approximately 1.8e12 furlongs per fortnight.

Oh yes, :-)

Well, if I didn't screw up the math, always a possiblility with me,
then .14uV across 50 ohms is -124.067 dbm, call it -124. With that
for a 10 db S+N/N, and assuming linearity, then the MDS of the 211
should be around -134 dbm, about the same as the 251A. That matches
with my experience. With a dynamic range of 75 db, that leads to
an intercept of -59.5 dbm for the 251A. That's truly awful, and
my experience says the 211 is worse. The SBL-1 used on the Mutek
board has a rated intercept of around +5 dbm (my books aren't
handy, but that's in the ballpark). The BFxxx used on the Mutek
board doesn't have anywhere near 64 db of gain. I don't have a
spec on that circuit, but I'd guess it's around 15-20 db. So
I'd guess that the intercept of the 211 with Mutek board would
be on the order of -10 to -15 dbm. That's pretty strong for a
VHF rig. Other factors may limit it to less than that, but they'd
be common with the older circuitry. So it looks like the Mutek
board buys about 44 db more dynamic range. This may be the wrong
way to calculate this, Zack you can critique.

>This doesn't address the problem that most really low noise figure
>preamps have way too much gain--20 or 23 dB isn't unusual. One solution
>is to hack out the gain in front of the mixer, which isn't for everyone.

I've thought a bit about this. One obvious, but not too bright way to
tame the preamp is to put a pad in it's output. But it seems to me
that you could design the preamp to have less gain without hurting
it's noise figure. Is this true, or do you have to optimize for
noise figure and take whatever gain you get?

>This neglects the issue of what you really need. Sure, a noisy
>PLL rig is 40 dB worse than a good rig in terms of ultimate
>signal to noise ratio. But is this important if all you ever

>hear is the satellite (the transponders aren't noted for S/N radio--
>though most designers aren't faced with all the restrictions you have
>up in Space). Terrestrial interference can certainly be a problem--but
>a better receiver isn't the only solution. 432 EME has been made much
>easier by cleaning up antenna patterns. Perhaps the same might
>be true for satellite work.

With the Mutek equipped 211, and an ARR GASFET at the antenna, a KLM22C,
I could watch the spin modulation of the noise floor of the transponder
pump the S meter on the 211. That's as good as it gets since the
transponder noise floor becomes the limiting factor.

I used to do another cheat, I took the scope output of the 211, IF
frequency, and fed it to a IC745 in general coverage mode. This let
me use the narrow filters in the 745 to get another effective NF
improvement. Now, the FT736R already has the narrow filters available.
One thing that limits the noise floor of the transponder is the
bandwidth it has. A 200 kHz wide receiver isn't going to have the
NF of a narrow rig.

: a repeater is required to have. No ID, no remote shutdown, etc.
: Should the FCC be asked to yank its type approval?

I think a more appropriate question might be regaring the legality of
using 49Mhz as the link frequency anyway. This is not acting as an
amateur repeater because the mike to radio link is in a non-amateur band.
If I remember correctly the FCC doesn't like the relaying of non-amateur
transmissions over our bands with the exception of shuttle ops with the
authorization of NASA. Is there another exemption for 49Mhz?

>you the trouble!

For FM work, a conversational style is generally preferred. A
20-50 millisecond beep doesn't interrupt the flow of conversation
as much as the 500-700 ms word "over". It's also easier to pick
up if the signal is noisy, or the listening environment is noisy,
such as in a car. It also can't be forgotten, or mistaken by a
sudden signal drop below the squelch threshold. That's the reason
NASA uses it.

From: mac20@cunixf.cc.columbia.edu
Message-ID: <1993Jun2.151625.18160@news.columbia.edu>
Source record: 280656

Firstly, the speed of light (in a vacuum) is 300,000,000 meters/sec
3*10^8 m/s or
300,000 Kilometers/sec (which is what you probably meant to write)

Secondly, the "choice" for using the speed of light is a result and a statement of Einstein's theory of relativity which, generally speaking, came about due to the need to explain real-world experiments of the time and "thought" experiments of Einstein's creation. Plus it was built on previous work of other scientists to some degree.

Not sure if this is still an answer to your question but i might point out that in classical mechanics a _particles_ kinetic energy is given by E=1/2 m v^2 and one popular tenant of relativity is that nothing can move faster then the speed of light.

>spur.

That might be even harder. The *harmonic* is from the 3.579 MHz color
burst frequency used in NTSC standard TV. Changing that would make
the Amiga's output incompatible with it's display system. One of the
real attractions of the Amiga is it's ability to generate NTSC standard
video. We use them in broadcast plants as cheap titling generators
among other things. BTW, nobody works the 146.76 machines from a
broadcast plant. There's enough 3.58 floating around to wipe out
any HT. Commodore *could* do a better shielding job, but HTs are
so sensitive that it's probably futile.

>front.

You're absolutely correct Pete. Triple conversion, with the first
conversion an *up* conversion, can get rid of birdies and images,
but it doesn't do diddle for intermod. The single best thing you
can do for intermod is a really stiff RF front end transistor,
say a CATV power transistor with at least 100 ma of standing
current. And follow that with a good high intercept DBM. But that's
not very feasible in a shirt pocket battery radio. So the second
line is good *narrow* preselector filtering ahead of the RF stage.
And that kills wide band scanning, and probably the shirt pocket
size as well. Reduced sensitivity is the last line of defense,
but with rubber dummy loads, that would limit range to pitifully
small areas.

You can have a good radio, or a scanner, but not both in shirt
pocket size.

>Looking for extended rx for the HTX-202 Radio Shack handheld..Any other help

This is getting to be an FAQ: though it is theoretically possible to
make an HTX202 do extended receive, the tight front end will render
the rig all but deaf outside 2m.

The upside is that intermod isn't the problem it is on other rigs.

>PS: Is it normal for the 202 to have a birde on 146.760?? Maybe that
>is common?? cul

The 146.76 birdie seems real, though on my 202 it sometimes smears
out from 146.73 to 146.76. The apparent birdie on 145.25 is CATVI -
channel 18's video carrier.

>pleased with the performance of my W2A. Opinions Please?

After looking over the field, I'm using Alinco 570 and 590 rigs
for dual band mobile operation. They have a low price and good
performance. I like the 570 a bit better, adequate heatsink and
no fan, built in duplexer, plus a better control layout. If you
need split antennas, or a remote head, the 590 is better. Note
590s are cheap since the 599 and 600 both supercede them without
offering substantial improvements.

I also like the Yaesu dual banders. The Icoms seem awkward in
control function, and much over priced. I haven't heard anything
bad about their performance, however, I'm just at the age where
big displays and big well separated controls are becoming important.
The less said about the Kenwood coffee warmers the better. A friend's
731 just ate another PA module even though he fitted an outboard fan
to it. Standard is an up and comer with some nifty features, but it's
also rather dear. There's no need to spend over $500 for a competent
dual band rig.

Well it's not a repeater under law. It's just operating with a Part 15
wireless control link. It's up to the licensee to maintain positive
control, and the radio offers that option with a jumper setting. The
only thing they do wrong IMHO is to not ship it that way by default.
To really use this thing to it's best advantage, however, a CTCSS
tone on the link would make it adequately secure and still allow
you to use it standing outside the car. I think it's mostly a gimmick,
however, and wouldn't buy one.

3498. Important!: Field Day Packet Contacts can be disqualified!

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-02 17:22:14 UTC
From: dana@lando.la.locus.com
Message-ID: <1993Jun02.172214.192485@locus.com>
Source record: 280669
Cross-posted to: rec.radio.amateur.policy,rec.radio.amateur.misc

I spoke to Warren Stankiewicz of the ARRL regarding packet operation at Field Day. He confirmed my belief that the "free" Packet station may use repeaters, either digipeaters or net/rom, and that the Packet station may operate on any band pursuant to the rest of the Field Day rules (i.e. 15 minute rule, etc.).

However, Warren warned me about two things that may not be obvious regarding packet operation for Field Day.

Warren said that packet contacts which use non-amateur means of communication, specifically Internet, are not qualified for Field Day points.

I asked Warren "What if you don't know that the Internet is being used?". He said "If we find out, those points will be disqualified". I did not specifically ask about wormholes such as the Simi Valley-CAPRA link, but I assume these are the same, they are non-amateur landline networks, which is what the term "Internet" generally describes.

My concern is that net/rom routes can be "opaque"; i.e., you may not know what kind of technology is used to link the nodes, and may inadvertantly make illegal Field Day QSOs. In fact, this significantly reduces my enthusiasm to use digipeaters or net/rom during Field Day, since virtually every contact there might be disqualified later. At the same time, it gives me an incentive to protest Field Day groups showing large packet totals, given the likelihood of the use of non-amateur services. This is not meant as an anal-retentive comment, just a conservative reading of the rules.

Another issue is that packet contacts, whether by a conventional station or by the Packet-only station, count as CW QSOs. Therefore, if you operate HF in your packet station, you need to make sure to dupe CW QSOs by any station with packet QSOs by any station. I.e., if you have a 20m CW station and he works KK6JQ on CW, and your Packet station works KK6JQ on 20m packet, you only get to count one of the QSOs.

In summary:

* Packet QSOs may use digipeaters and net/rom, but must not use non-amateur services, regardless of whether you know or not.

* Packet QSOs dupe against CW QSOs.

If you have any questions or comments, please contact "contest@arrl.org" or Warren Stankiewicz of the ARRL at (203) 666-1541.

>Tom Jennings KV2X
>jennings@abb.com

Tom,

I lived in Germany for two years, so maybe my advice will help.

First, you are too late to apply for a temporary license, but you can give it a try. Call the ARRL and tell them you want the reciprocal licensing information for Germany. They will send you a sheet or two with an application you have to send to the Deutsches Amateur Radio Club (DARC). The DARC coordinates temporary permits for Germany. Mail the information in ASAP, and write a note stating that you would like them to rush. I don't know if this makes a difference, but it might.

If you are lucky enough to get the permit before you leave (highly unlikely) then you'll sign a /DL or /DA on your American call depending upon your license grade. If you were going to be there a long time you could apply for a reciprocal license which is coordinated through the Deutsche Bundespost. I was DA2GM (even though the international callbook has been wrong for two years!) :(

As for operating on two meters, all the repeaters have tone burst (1750 cycles) so you'll have to learn how to whistle to bring repeaters up. The Americans in Germany hang out on a simplex freqency, but I honestly don't remember what it is (I left about 10 months ago). It's 144. something I think. The two meter band is only 144-146 MHz, and 440 is 430-440 MHz.

Another thing - while most German Amateurs speak English, German is usually the only language heard on the repeaters.

As for getting the radio in and out of Germany, for right now, this should not be a problem. Make sure (especially if it's a new radio) that you take a copy of your receipt with you. There is a remote chance that you may get questioned by customs, but it's never happened to me.

Since you hardly have enough time to get the license, I'd recommend leaving the radio home. There's not that much activity you'll be able to understand (unless, like me, you speak some German) and you CERTAINLY don't want to be operating over there without a permit.

73 and best of luck

Marc, N5MEI

I have the "birdie" on my HTX-202. It's true disconnecting the rubber ducky eliminates the noise. I tried 3 different rubber ducks and attaching any of them will cause the noise to appear, I also tried a discone via 15' of RG-8 and I get there birdie with it also. So I don't think the rubber duck is oscillating :-)

It's probably picking up some outside noise (like from a computer) and mixing with internal noise or oscillators to produce the birdie on 146.76.

>as much as the 500-700 ms word "over". It's also easier to pick
>up if the signal is noisy, or the listening environment is noisy,
>such as in a car. It also can't be forgotten, or mistaken by a

None of these reasons bears out in practice. I have been riding
down the road listening to a repeater with a beep of some
description, hearing the conversation back and forth. Later,
upon turning up the volume I discovered it has a reset beep;
so much for noise immunity. I have also heard impatient hams
reply to a weak station who had momentarily dropped out of
the repeater's receiver long before any beep came around.

As I said originally, good operating technique obviates the
need for beeps. That's why I operate repeaters without beeps.

Simply replacing one noise with another doesn't really
make the repeater easier to use, plus it makes appliance
operators out of folks by insulating them from the actual
conditions on the repeater.

>sudden signal drop below the squelch threshold. That's the reason
>NASA uses it.

That seals it. In my experience, if NASA uses it, then
it CAN'T be a good idea.

Yes I am sorry, I quoted the wrong servers.

The servers posted by Mike Brand in the orignal post were:
callbook@sat.datapoint.com & (server run by email)
callbook@n8emr.cmhnet.org & (server run by email)
callsign.cs.buffalo.edu (access by telnet)

I only tried the first two with the call KD1GG issued to me on
Jan 14, 1992.

callsign.cs.buffalo.edu is a bit more up to date but still old, I
upgraded to Extra on June 10, 1992 and it doesn't show up.

: CD-ROM with 500+ Mb of amateur radio related data, information and software.
..

I agree with what Scott said. The callsign database is up-to-date and
the retrieval software is VERY fast. What they do is include the entire
database 4 times sorted by name, call, city and zip. Format is straight
uncompressed ASCII, resulting in over 200 megabytes of storage. Since
space on a CD ROM is virtually free, this method works very well in the
CD-ROM format, but makes it inpractical to copy, unless you have a
VERY large hard disc!

The CD-ROM would be well worth the $15 just for the callsign database, but
there's lots of other interesting stuff as well, as Scott listed.
This is not your typical cheap CD-ROM with megabytes of "garbage" files
downloaded from some bulletin board.

The 00_INDEX.TXT file in the root directory contains a list of all the
files on the disc, most with short descriptions. Don't try to print out
the file, though, as it runs to over 1000 pages. (Anybody need any scrap
paper? :=) 98% of it is the rec.radio.amateur.* files, however (one file
per posting): If you print out the first 12 pages and last 16 pages,
you'll get all the rest. By the way, there is a program in the root
directory called CDF.EXE (CD Find) to search for keywords in the file
descriptions listed in the 00_INDEX.TXT file.

From: dts@banyan.com
Message-ID: <C80CM1.2KC@squam.banyan.com>
Source record: 280675

Another reason for courtesy beebs: On many of our local repeaters we have a one or two second pause between carrier drop and the courtesy beep. This is the proper time for someone wishing to interrupt the ongoing qso to make use of the frequency (eg. for emergency traffic, to call someone and move them to another frequency, etc).

Without this time delay and beep there are occasions when persons needing to make an emergency call cannot get through. Since the beep also signals the timer reset, the timer and beep enforce operating procedure that ensures repeater availability for emergency traffic.

OK, tell me how you'd deal with a conversation with another ham where you're
both full quieting and the repeater has a Micor squelch circuit - which
removes the noise burst of a conventional squelch closing. How does good
operating practice help here?

>Simply replacing one noise with another doesn't really
>make the repeater easier to use, plus it makes appliance

How about repeaters where the beep serves a telemetry function, as well...for
example, the one I hang out on goes "bee-boop" on carrier dropout, and *both*
those tones mean something.

>That seals it. In my experience, if NASA uses it, then

Ah, yes. One of those government manuals -- I think this one spelled Bristo
right -- used the word *alinement* throughout. Yes, my Xcelite set of
spline wrenches calls them Bristols. It *does* seem like a typo.

3516. More on the Radio Shack HTX202

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-02 20:43:07 UTC
From: donrm@sr.hp.com
Message-ID: <C80HJw.2KA@srgenprp.sr.hp.com>
Source record: 280732

The HTX202 is proving to be a pretty popular radio. It well should be, it was selling at a super price during Radio Shack's sale of a week or so ago.

However, as others mentioned previously on the net, I found a few undocumented "features" in my HTX202 and others I've tried out. Here's my findings on my particular unit; it's pretty subjective, so take it with a grain of salt if you want.

1. There is indeed an in-band receive spur at 146.76. This signal is radiated out the transceiver's case and into the rubber duck antenna. It reads about 3-5 on the LCD S meter. You won't hear it with an external antenna removed any distance from the radio itself. Fishing around with an antenna probe shows most of the radiation coming from the keypad. I haven't figured out all the "tweets" associated with this radio, but at first glance this spur appears to be caused by the 41st harmonic of the uP clock (operating at 3.579545 Mhz). Changing the crystal frequency would move the spur to a less-popular channel, but might throw off some of the radio's timing and affect DTMF/CTCSS tone accuracy providing these are generated by the CPU. BTW, if you hold the HTX202 close to the antenna of a communications receiver tuned to 3.58 Mhz, you can hear the color-burst crystal radiation. You can also hear the 146.76 spur on another 2-meter radio held close to the HTX202.

2. The second weirdness involves the power save option. With the radio's duty cycle (PS in the configuration menu) set at something less than 1-8, and SAVE feature enabled, the RPG (tuning knob) hangs up when manually selecting memory channels. The up/down buttons work normally, as does the 1-16 duty cycle.

3. Another interesting glitch is the way the radio behaves when the battery fails. When the "batt" icon appears on the LCD screen, you will not have much time left for transmission. Further transmitting will blank out the LCD display screen, but the radio keeps transmitting at the last selected frequency, although with some very hairy-sounding sidebands. Releasing the PTT switch does nothing - the radio keeps transmitting until the power is switched off. You also can't get any mike audio thru the transceiver at this point.

4. I find the DTMF REPLY feature unusable with transceivers having long DTMF/PTT transmit hangtimes. By the time the inquiring transceiver has gone back to receive, the HTX202 has already sent out the DTMF # reply. I think the HTX202 should really respond after some time delay or upon local squelch closure to make sure the inquiring transceiver has recovered back to receive mode.

The receiver is pretty sensitive. I checked mine at about 0.18uV/20 db quieting. The first LO leakage out the antenna port is about -57dbm. As mentioned previously, I also found a lot of the leakage coming from the keypad area. BTW, the first LO radiation falls from 122.6 to 126.6 Mhz, so I'd be pretty careful using this radio near operating aircraft.

Someone mentioned transmitter hang-on when tone squelch is used. My unit stops sending PL tone as soon as the PTT is released and the transmitter drops off about 100 milliseconds later. The unit doesn't send out any type of "reverse burst".

Anyway, great radio, great price. Anyone know when the HTX202A is coming out?

3517. Advice on teaching an 8 year old

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-02 20:54:05 UTC
From: cheech@med.unc.edu
Message-ID: <1uj41d$ffu@samba.oit.unc.edu>
Source record: 280737

I know this subject comes up every few months, but I didn't think I would need it this soon last time around.

My 8 year-old has decided that he wants to get a license so he can play with Dad's radios, too. His stubborn determination once he decides to do something leads me to believe he will probably succeed. So, I need advice from those with experience in teaching young children amateur radio theory and regs. I'd like to know what worked for you and the kids you taught.

Aside from the philosophical problems (I'm an academic type, twenty years in school, three university jobs), I don't think memorizing the question pool would work for my son. He *has to* understand things.

Given the perversity of the universe, he will probably learn the code easily. I had to sweat blood over it. Suggestions on the best way to teach the code will also be appreciated.

Since this topic has been discussed recently, email replies are probably in order. If there is interest I will summarize to the net.

Thanks much,

Greg Young AC4YT

> free space), Does anyone out there know why Einstein used the term
> c in the famous equation, E = mc(squared), where c = velocity of
> light (300,000 mtrs/sec) ??
> Seth T. KC2WE

Seth: you gave the wrong velocity (already corrected by others) and
the energy of a mass at rest. Actually energy is the sum of potential
energy and Kinetic energy so the true general equation is
E = mc^2 + 1/2mv^2. (Kinetic energy is 1/2 mass x velocity squared)
Einstein showed that mass and length and velocity are relativistic,
i.e. there's a term which is related to the ratio of velocity^2 over c^2.
so mass becomes m over square root of (1-v^2/c^2).
So the general equation for E = mc^2 / (1-v^2/c^2) ^(1/2).
If you expand and approximate you get E = mc^2 + 1/2 mv^2.
Now, what was your question? (Einstein's relationship makes relativity,
and conservation of energy work for all velocities ---I think he
had several false starts like E= mx^2 but none of those initial tries
looked right!)Einstein came up with this real great definition which
not only looked like old fashioned energy (mass and velocity squared)
and also fit his brand new theories and worked in the real world!
That last part is what most of us have trouble with.

3519. Re: Repeaters with those damned beeps

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-02 21:05:25 UTC
From: phil@hansen1.ncd.com
Message-ID: <1uj4mlINNmeg@rosebud.ncd.com>
Source record: 280733

On my repeaters those "darn beeps" server many purposes:

Two beeps - User is talking on this local repeater)
One beep - User is talking on the remote repeater)

Morse 'B' - Repeater running on Battery power
Morse 'BF' - Battery is less than 11 volts (battery failure or run down)
Morse 'P' - Refected power is above normal (aka antenna failure)

So these help me, the person who spends weekends driving to the mountain tops,
keeping the repeaters running well.

How does a "Squelch Tail" do all of this? Answer... It can't!

I know some hams who prefer the standard squelch tail and some who don't.
Ahhh the value of being a free country... You can put up a repeater and have
the type of squelch tail that you like :-)

3521. [Q] oper. rules for 49mhz "Part 15". Unlicensed?

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-02 21:26:43 UTC
From: erik@peewee
Message-ID: <C80JKJ.KwH@avalon.chinalake.navy.mil>
Source record: 280736

In a radio service publication I ran across this phrase in a section
regarding FCC rules:

"These radios will be, at best, 'starter' units ... targeted at those
who desire a 'step up' from existing, unlicensed 49 MHZ (Part 15)
or 27 MHZ (CB) capabilities."

Obviously I am familiar with CB, but what is this 49 MHZ Part 15 ?
What are the rules of operation?

Thanks

>operation.

My response:

----- Conservative viewpoint -----
Ignorance of the law is no excuse.

----- Liberal viewpoint -----
The FCC should institute a literacy program to make sure everyone
can read after which a notification would be issued reminding everyone
in the entire universe of the law (this is the U.S., the policeman
and conscience of the world) as aften as necessary to ensure no one
is missed. Meanwhile, legislation should be passed entitling (ooops,
giving everyone not currently holding a license, the "RIGHT") to own
and use freely, radio transmitters that tune DC to light. We wouldn't
want an election to be lost because the unlicensed were unfairly
discriminated against.

> and frequency modulated simultaneously will yield a single-sideband output."

Bruce-

While I've never heard of this, I was aware that either an AM signal or an NBFM signal, can be detected as if it were an SSB signal. Therefore, I would expect that a low level AM or NBFM signal could be passed through an SSB filter, to produce an SSB signal. The limitation is that real filters would not have adequate carrier rejection to produce SSB/Suppressed Carrier.

Early methods of producing SSB/Suppressed Carrier, involved combining the carrier and voice, with both voice and carrier signals phase-shifted 90 degrees. The voice phase-shift network was somewhat of a compromise, since it had to cover the 300 to 3000 Hz range. This phase-shift modulation scheme produced SSB/Suppressed Carrier, without using a filter.

While the phasing method hasn't been widely used in more modern times, its limitations may have been due to the technology that was current when it was developed. If newer methods could be applied to make it practical, there might be immediate applications in miniaturized transceivers.

With regard to the ARRL reference, I wonder if the resulting SSB signal has much carrier suppression? If it is related to the phasing method, it just might be the "newer method" needed to do the job.

> specific radar license for it...
>
> What's the deal here? Do we (PD's) need it or not?

The posting concerning no separate, special license for radar is correct.
If an eligible licensee in the Public Safety services (Local Government,
Police, Fire, Highway Maintenance, Forestry-Conservation but not Special
Emergency) has a valid license for its normal two-way radio system, there
is no requirement for a separate license for speed determining equipment.
However, the speed determining equipment must conform to the type acceptance
rules.

The no separate license would not cover a business or would it allow non-
type accepted equipment (except for some grandfathered equipment).

There's also ham.njit.edu 2000 ...

But I find it peculiar that you got your call on 01-14-92 and weren't able to find your record, while mine came through in June of 92 and I'm in there under my old call. The new one, well, I don't think so but I do hear the databases get updated yearly around June or July. So that means it SHOULD make it. :)

> light (300,000 mtrs/sec) ??
> Seth T. KC2WE

This reminds me of a cartoon by Sidney Harris which show Einstein standing at a blackboard with three equations written on the board. The first two, E=ma^2 and E=mb^2, have both been crossed and he is writing the equation E=mc^2 (by the way Sidney Harris is very good at poking fun at scientists, if you can find his bood "What's so Funny About Science?" it is worth the time to thumb through).

In a more serious line, c has been the symbol used for the speed of light for quite a while. I don't know if it predated Einstein but I suspect it did. The equation above (E=mc^2) drops out of his work on relativity and is a result of the assumption that the speed of light is a magic number that represents the fastest that anything can travel (put quite simply).

3529. SUMMARY: how to help 8 yr old pass exams

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-02 22:57:04 UTC
From: peterson@physc1.byu.edu
Message-ID: <1993Jun2.165704.681@physc1.byu.edu>
Source record: 280757

Recently I inquired about the best way to help an 8 yr old pass the exams.
I got several good replies along with a few comments questioning whether an
8 yr old can understand enough of the material to actually be a responsible
ham. I don't question the understanding part but don't feel that it is much
different than the adult who memorizes the exams by keyword without actually
trying to understand the material (please don't flame me for that - just an
example of two groups that learn using the same methods).

After looking over these I have purchased some tapes made by Jerry Ziliak
to try him on (it's an expensive test). The code tapes will help me get
up to my desired 20 wpm (currently at about 9) and get him started. The
video tapes will hopefully get him through the novice written. I also have
several code practice programs for the pc but haven't tried him on any of
them yet. I also will need to get a practice exam generator for the pc
that uses the new question pools because I don't think it is practical to
expect him to make an exam in June June at this point. Currently, he has
only made it through about 20 minutes of the videos after 3 weeks.
It appears that I need to give him more incentive and encouragement.

Thanks to everyone for their suggestions and comments.

Bryan Peterson (peterson@physc1.byu.edu)

Here are the replies (edited some to reduce the volume) I received (I
apologize for the delay in getting this summary out):

The way they got around any FCC type approval was by using the 49MHz
band. If the guy had read the directions he got with his MW-1 he'd know
there's a mod that Yaesu spells right out in the book to prevent this.

Do what I did with it, send it back and get your money for something more useful. The audio from the unit does indeed rot, not to mention any old 49MHz source tripping the xmitter. When I got mine I tested it out in the house first and I realized as soon as I plugged the remote unit into the radio, the radio would key up. That's when I made the modification. But even in the car, people kept telling me my audio was extremely weak. I tested the battery out, it was fine. The unit is just a piece of crap, plain and simple. As for safety, what factors of the MW-1 contribute to that? I mean, yes you can adjust things like volume, squelch, balance, and most importantly change bands. I don't know if this exists on the 5200 but on the 5100 (a much better radio in my opinion. But why didn't they make it with detachable face?) you can remove a jumper so that the d/mr switch on the mic becomes a band switch. VERY convenient. Even Yaesu strongly recommends this modification. If that's the case, why the heck don't they market the radio like that?

Oh well, I'll get down off the soapbox.

>Well it's not a repeater under law. It's just operating with a Part 15
>wireless control link.

I agree it's not a repeater, the wireless mike is just device covered under
part 15 being used appropriately. But it is appears that the amateur
transmission done using the wireless mike as a source might be prohibited by
97.113(d)(3), the relevent text says:

(3) No station shall retransmit programs or signals emanating from
any type of radio station other than an amateur station, ...

The only question is whether a wireless microphone counts as a "radio
station" and would thus be prohibited as a source for amateur transmissions.
But I can't imagine that anyone would possible care about this use of a Part
15 device. I hope the FCC (and us) have better things to do.

AC4YT DE N6UOK

Greg, I'd suggest two strategies that work especially well with younger learners: individual instruction and exploratory learning. What this means is that you work hand-in-hand with your child in acquiring knowledge via hands-on experience. I would suggest you consider getting an "electronics experimenter's kit" for your son, such as a Radio Shack model 28-259 ($29.95) or similar. I'm not endorsing a particular brand or model; just pointing out that learning theory through experimentation works best for kids. It's important to have a knowledgeable person be close at hand to guide the child in the right direction. I had an electronics kit as a child, but no mentor nearby; that was a drawback. Your son will fare better with your presence.

Morse code should be an easy task; young children can pick up virtually any symbolic system with minimal effort. As one trained in the teaching of foreign languages, I can attest to that! The trick is to use code every day. Try talking to your son via morse code ... call it "dad's secret code" that mom can't hear! Or maybe she does -- anyway, you get the point. Kids learn fast but forget fast, too. Practice retains knowledge. Make it fun to practice.

Good luck, and be sure to tell us your son's callsign when he gets it!

753 25000 492 59% 491 873.2 5% 0.03 1.1% alt.radio.scanner
913 21000 412 75% 12 23.5 17% 0.00 0.9% rec.radio.noncomm
923 21000 404 74% 401 848.0 2% 0.05 0.9% rec.radio.amateur.policy
962 20000 386 62% 132 815.0 3% 0.04 0.8% rec.radio.info
1037 18000 355 73% 84 182.7 6% 0.01 0.8% rec.radio.cb
1252 14000 278 49% 84 109.1 1% 0.01 0.6% alt.radio.pirate
1271 14000 273 63% 156 403.3 5% 0.03 0.6% rec.radio.broadcasting
1715 7700 152 36% 7 8.4 14% 0.00 0.3% rec.ham-radio
1725 7600 150 35% 7 8.6 14% 0.00 0.3% rec.ham-radio.swap
2083 2500 49 16% 61 123.2 58% 0.01 0.1% aus.radio
```

Several positive trends continue this month. Readership counts are
up in all newsgroups. The moderated newsgroup rec.radio.info continues
to be carried at more sites. It has overtaken rec.radio.cb, and is now
almost tied with rec.radio.amateur.policy and rec.radio.noncomm.

On the negative side, rec.radio.amateur.misc continues to have an extremely high cost on a per-user/per-month basis. Bad news for convincing news administrators who pay for news to carry it. Also, the defunct rec.ham-radio hierarchy reappears this month. If these newsgroups are still active at your site, please try to persuade your news administrators to delete them as these groups have been rendered obsolete (for about 2 1/2 years now) by the rec.radio.amateur hierarchy.

Bad idea, this stuff is hygroscopic. It will appear to work for awhile,
but then it starts absorbing water.

Silicon rubber works, but it is slightly acidic and will slowly eat the
metal. Best bet is to buy the expensive silicon rubber potting compound
that comes in two parts. The cost is worth it if you don't want to spend
time wondering why the antenna system is slowly going to hell in a bucket.

Coax-seal(tm) is that gooey black stuff in tape form that is available at
most HAM type stores. It will seal the connectors from the outside. It is
worth the investment and works as advertised.

Finally, there is a liquid connector coating (The trade names escapes me
at this time) that is specifically designed for mating connector surfaces.
And it works exceptionally well too. This combined with the Coax-seal will
make the connectors and coax less than the weak link in the system.

3540. Kenwood DRU-2 adjustments?

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-03 01:37:57 UTC
From: MOWE%SLUMUS.BITNET@cunyvm.cuny.edu
Message-ID: <02JUN93.23363163.0009.MUSIC@SLUMUS>
Source record: 280759

I recently acquired a DRU-2 Digital Recording Unit for my
TS-850. This is the gizmo that lets you record a few seconds
of voice transmission.

The audio level of the DRU-2 seems to be mighty high; it sounds
quite rough when I listen to it in "play" mode. It's certainly
hitting the mic input harder than my microphone. This same
phenomenon was noted by Rus Healy in his QST review of the '850.

Anyway, my question is this: does anyone know how to adjust the
output level of the DRU-2? I called Mr. Kenwood and the "technican"
who answered was, shall we say, "uninformed." The User's Manual
schematic is unreadable (at least to me). I sure don't want to have to
adjust the mic level each time I use the DRU-2.

Any suggestions would be welcome.

phil@hansen1.ncd.com (Phil Graham) writes:

| Morse 'B' - Repeater running on Battery power
| Morse 'BF' - Battery is less than 11 volts (battery failure or run down)
| Morse 'P' - Refected power is above normal (aka antenna failure)

We have pretty much the same thing, but not every over:

Low-pitched 'B' Battery voltage low (less than 11.4v)
Mid-pitched 'B' Mains failure - battery in use (less than 12.4v)
High-pitched 'B' Battery voltage high (more than 14.5v - charging)

Low-pitched 'F' Low RF output (not switched that way)
Mid-pitched 'F' High PA current
High-pitched 'F' High SWR (ref pwr > 25% of normal for pwr)

Low-pitched ident Repeater switched (or commanded) to low power
Mid-pitched ident Normal
High-pitched ident Intruder alert

(Tones are approx 600, 1000 and 1600 Hz respectively)

| So these help me, the person who spends weekends driving to the mountain tops,
| keeping the repeaters running well.

Me too, but I can also command it to send various telemetry readings of
all sorts of things (battery voltage, final current etc).

| How does a "Squelch Tail" do all of this? Answer... It can't!

No, but getting the beeps every over would get annoying after a while.
That's why we do it about every minute or so.

| I know some hams who prefer the standard squelch tail and some who don't.
| Ahhh the value of being a free country... You can put up a repeater and have
| the type of squelch tail that you like :-)

Those "roger beeps" are getting more popular in Australia; I hate them
because they jam my scanner :-)

I'd be very surpised indeed if 2 meter amateur handhelds caused interference with the instruments or radios on board aircraft. Since the am air band in use by pilots often with handhelds runs from abourt 110 to 137 mhz, I'd be surprised if 144 mhz transmissions were more of a problem.

They have been making ham,commercial,marine radios for over a decade as
to the best of my knowledge. In ham brands, Yaesu,Icom,Kenwood are the most
popular brands, but there are also Standard, Alinco, Azden, Tokyo Hi-Power,
Belden (sp?), JRC, etc, and these are just for transceiver for popular
bands from Japan. Alinco is actually a much late comer than Standard. Standard
was "branded" as Heath (the kit brand :), some years ago, for their HTs, before
they were selling as their own brands. Standard seems even better in commercial
and marine markets, than for hams, just in North America.

I always thought that it was traditional for someone to pick a letter (from whatever alphabet they preferred) that was not already used in the field in which they were operating, and to studiously ignore its prior use in any other field. 20th century science is handicapped by most of the really good letters having already been claimed. Today the ransacking of the Roman and Greek alphabets is complete, Hebrew and Katakana live in fear. There could be no other reason than it was all that seemed untenanted in his areas of interest.

For those who don't like furlongs per fortnight, unsolder D19 and re-start the universe while holding the <shift><VFO B> keys down and it will come up in parsecs per picosecond. If you have the latest handheld intermodulation teaching aid, you can enter your own choice of speed of light with a simple 15 key sequence.

Cheers

Gary, here is where I have to disagree with you. For years before
becoming a ham I had read that the good and law abiding ham did not use
foul language on the air. The first time I heard a conversation on 75
meters I was appalled. I could not believe the language I was hearing.
While I do have a volume knob and an on/off switch; it was too late, I
already heard the conversation. Now I can't say that I heard words that I
have never heard before but to hear hams using that kind of language on
the air was a great surprise and I can only hope these guys are in the
minority and someone is out there to gently remind them that this is not
proper ham operation and if that doesn't take hold more drastic action be
taken.

I step down from the soapbox,

Whoa there. If the "service" were for pay, and self-sustaining, then a
non-paying customer's input would still have some validity, albeit
limited, especially if the comment were: "I'd like to use you service,
but it fails to meet these needs..."

As for teh callbook servers: well, I am trying to get mine working
here. It involves some fairly gnarly technical problems, so I am going
slowly, and my users, none of whom pay for access, either to the 'Net
News, 'Net e-mail, nor use of my BBS, are being patient. Their input,
however, is VERY important to me, and the fact that I have offered
some level of service then obliges me to maintain some level into the
future, or withstand the inevitable barrage of whining and bitching
that follows change and cessation.

By offering this service, whether for fee or for free, the callbook
servers have entered the realm of "information utilities" and they
have accepted responsibilities to provide an acceptable level of
service...or "suffer the slings and arrows" of this hostile mob! ;^)

Since I am having a hard time imagining everyone who posts here as
paying for the fully allocated costs of the service they "enjoy" on
the 'Net, and since there is an incessant level of whining and
bitching that goes on, would you care to level that same argument
against your peers on the 'Net? I hope, for your administrators sake,
you opt not to, but since I am not paying you, I suppose my opinion on
that has no value either, huh? ;^)

If the callsign servers are to be connected, one should have a clue,
BEFORE seeking to retrieve callsigns, what the limits of the server
are, PARTICULARLY limitations as to currency of data. Charge or no
charge, the potential user has the right to know, *and* to complain
when the service is not up to expectation (or "advertisement").

> That isn't the point. If the user is not willing to pay for the service
> provided, he has absolutely no say on the level of service. Beggers can't
> be choosers.
BZZZZZZT! Wrong Answer! There is no mechanism to collect or charge for
the service, and such a mechanism might jeopardize the buffalo.edu
presence on the 'Net, especially given the funding sources for their
connection. It was set up to provide a service, and provide that

service it does...just the service has far less value now than before
because the data is the database in drawing Social Security! ;^)

And, since your own site(s) are similarly funded, I suspect you are
not paying for any of your access, provide no services like the
callsign server, and are probably fairly presumptuous to try answering
for those people who *do* provide free services... particularly when
you presume to know my expectations and what surprises me... ;^)

OK, so calm down and relax. There are plenty of solutions, many of
them actually might work! ;^)

> I really don't want to
> use an adapter; I'd like to put an N connector directly on the RG-58.
> Does anyone know if such a connector is made?
Yes, at most of the recent hamfest I have been too there have been two
or more vendors with a box of silver coated "N" connectors that will
accept a "regular" RG-58 adaptor, the same as fits a PL-259. They are
easy to assemble, and while not waterproof, I suspect you do not care,
since your concern is the RADIO end of the transaction.

> If there's not an N connector for RG-58, how about a PL-259 to N adapter?
There is, but just in case, Radio Shack has such an adaptor, (278-156)
which is a female UHF to Male "N", permitting your PL-259 to connect
to the female "N".

> Is that going to be very lossy, or change the impedance significantly?
This I suspect will vary with how well you make your connections. At
440Mhz, I do not think the loss will be significant, and I do not
believe the impedance bump is significant either, but then I have used
my adaptor at HF to tune a mobile antenna -- yes, I used an "N"
connector for waterproofness and the SWR analyzer is UHF connector-ed.

> And how about an N to BNC adapter, for that odd case where someone might
> want to hook up an HT to an antenna with an N on it?
Given that the UHF-N adaptor exists, and given that BNC-UHF adaptors
are very plentiful, and given that the boost an HT gets when connected
to a real antenna (as opposed to the rubber dummy load) will likely
overcome any added loss from the adaptors, just drop by Radio Shack
and pick up a few adaptors and enjoy your new radio...

Why bother? The TS-820 came with an optional DC power supply, the DS-1A.
It was a DC-DC converter, and when you unplug the AC line cord, you plug
in the DC line cord, and the power supply functions. Get the 820 service
manual if you can't find a DS-1A, as the circuit looks really simple -
basically a couple of transistors in a multivibrator arrangement with a
transformer.

I wanted to bounce this off you radio active types...

I visited an ex-employer and current friend just to see what's doin' today, and he's redoing his radio systems and making the move to 800MHz.

He came up with several uniden M8100a's, which he has some concerns about 800Mhz. The documentation says they put out 6 watts per his memory.

At anyrate, he was worried about the things he's heard about 800 and got a goldfish and put in a ziplock baggie w/ water and places it about 3" away from the antenna. He then dead key'd the system for ~3 minutes, after which the fish was dead.

This isn't urban myth, And the fish was in it's own water (no clorine and oxygenated), this was done.

I thought I read somewhere RF around this region really penetrates about 3cm or so into living tissue (actually heats it), so my stab at it was the fish was less than 3cm thick and basically couldn't deal with heat buildup, though it was in water.

SPCA need not reply. I didn't do it!

Don't overlook the earlier Henry amplifiers - the 6N2 and 2002, which were equipped with 2x8874 triodes.

My experience of those (I have a 2002 ...) :
Feeling that my amp was a little 'long in the tooth' I acquired a newer 2002A, which was equipped with a single 3CX800 tube. After a three month evaluation period, I gave the newer amp to my dog for a garden toy :-)

My perspective is that the earlier, twin tube amplifier is far superior to the current model (easier to tune, more stable, more gain, more output, etc). Of course, this is only _MY_ view - I'm probably wrong, as usual.

Anyone with an unwanted 6N2 or 2002 would be well advised to contact me!

Precisely. You would think, wouldn't you. that someone who has
a specific responsibility for realism in movies would wonder
if any theatregoers would have a knowledge of morse and be
able to tell whether the actor was really sending it, as opposed
to merely pressing a key. I suspect that many amateur radio
operators would also cringe at the way they operated the morse
key. I presume there is a specific knack to it and not
merely a case of banging down on it with the palm of ones hand!

At least, the British Detective Series, Inspector Morse in its
final play-out music starts off playing M O R S E in morse
code.

3V, DJERBA ISLAND (NEW IOTA). John, WG9B, talked to Paul, ID1X (a.k.a I1RBJ) and Paul has stated he will activate a new IOTA by going to Djerba Island (this will count for Tunisia). He said that his tentative callsign will be 3V/I1RBJ, however, he has applied for a regular 3V callsign. Paul states that this will be the first time that the island has been active and that he is still waiting for an IOTA number. He plans to arrive on the island on July 1st or 2nd and stay until the 8th. Paul will be using a TS-50 into a vertical antenna. QSL via I1RBJ.

3Y, PETER I ISLAND (Update). The following update is an excerpt from Ralph, K0IR, team leader of the 1994 DXpedition to Peter I Island:
The Peter I DXpedition team will sail from Port Stanley in the Falkland Islands on Jan. 23, 1994. Their vessel will be an icebreaker that can steam through pack ice 8 feet thick. There will be two helicopters aboard, and it is fully equipped with satellite navigation and satellite derived ice chart recorders. Helicopter landing on Peter I is still scheduled for Feb. 1, 1994.
The four HF transceivers and amplifiers will be augmented by the following Cushcaft antennas: two A3S tribanders, one A3WS WARC beam, one 15-3CD monobander, one 20-3CD monobander, and one 40-2CD monobander. Vertical antennas for 160, 80, and 40 meters will also be in use.
The operation is still scheduled for 16 days to allow everyone an opportunity for a QSO despite conditions. SSB, CW, and RTTY will be utilized.
There is a full complement of operators, however, two are still working out their personal schedules. Alternates are available and more will be considered. The full team will be announced when everyone's schedule is a 100% go. Contributions for this expensive endeavor can

be sent to AA6BB.

5A, LIBYA. It has been reported that Romeo has been in Sofia this week to pick up some items that INDEXA has provided. His expected route to 5A-land is from Sofia to Turkey, to Egypt, and then to Libya. It was reported Saturday (12/Jun) that Murphy, W4WMQ, talked to Romeo by phone in Sofia. Romeo told him that the 5A operation will take place in 3 to 5 days and that everything has been worked out. There is still no mention at this point of any other operators, or their involvement.

6W1, SENEGAL and J5, GUINEA-BISSAU. Mark, J5UAI, who is now active from J5-land will be active from 6W1-land for 5 weeks starting July 2nd and then return to J5 August 10th. Meanwhile, Mark has gone QRT from RTTY as of June 9th because he had to return a borrowed lap-top from a fellow embassy worker. Is there a club that will loan Mark a lap-top computer until he QRTs in July 1995? QSL via NW8F.

BV, PRATAS. A dxpedition is being planned to Pratas Island from June 25 to July 5. Flights to and from the island take place on the 5th, 15th and 25th of each month. Tom, BV4OB, was mentioned to be one of the 12 operators and it was also reported that there are three position still open to participate in the DXpedition. Martti Laine, OH2BH, has been invited along with several other stateside hams. The call sign that will be used is BV9P. They will be active on 10-40 meters. The modes to be used will be CW, SSB, RTTY, SSTV and OSCAR 13 Mode B. Currently there is an application pending for new country status for consideration by the DXAC.

C5, The GAMBIA. Remember to look for Falk, DL7UTA (a new NODXA member), and Roy, DL7UBA, from here starting June 16 for two full weeks. C56/DL7UTA will be used on SSB and C56/DL7UBA will be used on CW.

CY9, ST. PAUL ISLAND (UPDATE & MORE!). Art, WA2UJH, will be joining Duane, WV2B, on St. Paul as reported last week (OPDX.114). Art will be active on CW and RTTY on all bands, including the WARCs bands. QSL only CY9/WA2UJH to NW8F.
It was reported on the W2MIG net that CY9CWI will be active August 14 thru 18 on CW, SSB, and RTTY. There will 7-8 ops.

E35X, ERITREA. The operators shut down E35X on June 9th at 2353z. It was reported that part of the equipment that was used during the operation, was moved to a government building (actually a technical college). This will be the site of Eritrea's first club station. The removal of the Mosley TA33M beam (which was part of the promised club station) during the final days of E35X, left the operation with only a dipole and a vertical antenna. LA6VM has reported that INDEXA shirts and flag were presented at a dinner and gala affair as part of a "THANKS" for the station. As of yet we do not know the call sign of the club station.
It was mentioned on one of the DX nets that you can put all QSLs in one envelope as long as there is sufficient postage for the return postage.
There will be another Norwegian team active from here towards the end of the month. No call sign was given.

ZS1, PENGUIN ISLAND. Gunter/DK2WH, Peter/DJ2ZS, Roland/DJ4LK and James/ DJ0WQ will be active July 28 thru August 24. Activity will be 10-160 meters. They will be taking with them 2 complete stations, with beams, ground planes and amplifiers. All QSOs will automaticlly be sent to the bureau, but if you wish to QSL direct, PLEASE enclose sufficient postage for return mail. Also, Peter and James may operate from ZS9.

ZS8, MARION ISLAND. K8KJN reports that ZS9A, Ian, talks to Christy, ZS8MI regularly and that ZS8MI is not using normal U.S. SSB frequencies. ZS8MI typically operates around 14115 with the Canadians. ZS9A has been encouraging ZS8MI to set up schedules for U.S. QSOs. It seems that the encouragement has paid off. Paul, W8GIO, announced Saturday (12/Jun) the following operating schedule: 14277 at 0500z and 21393 or 28480 kHz at 1600z (Time could actually be 0300z and 1400z.). Christy is scheduled to be there for 18 months. QSL via ZS1CDK, not ZS5UND. It was requested that 2 green stamps and SAE be sent due to the recent postage increase in South Africa. QSL Route: Christy de Kock, 10 Mark Ottor Ave, Unipark, Stellenbosch, 7600 RSA.

DX TIDBITS..... Marko, OH6DO, reports that 9M0S made about 37K to 38K QSOs. It was also mentioned on one of the DX nets that they will be using a computer label on the 9M0S cards. The labels will be good for up to 3 contacts..... The 1993 Amateur Radio Awareness Week in 9Y4 will be held from June 13 to June 20. The Trinidad and Tobago Amateur Radio Society (TTARS) will be having an AMATEUR RADIO AWARENESS WEEK so as to sensitize the public about amateur radio. This celebrates the sixtieth aniversary of the Society. From 0000z on Saturday, June 19, to 2200z Sunday, June 20, there will be a special event station, 9Z4LX on all bands and on all modes. 9Z4LX will be QRV on all DX portions of the bands. Dev, 9Y4DG, will be operating on AO-13 (attitude and magnetorqueing permitting). All QSLs for 9Z4LX and 9Y4DG go to WA2NHA... .... The second annual New Orleans International DX Convention will be held on Friday, August 27th through Sunday, August 29th, in the heart of the French Quarter in New Orleans, Louisiana. It will be DX and only DX with presentations by participants in several recent major DXepiditions. No dealers and no flea tables......

FAX YOUR DX INFORMATION NOW! Faxing is available Monday/Wednesday/Friday from 0430 to 2330z only. The number is 216-237-8208 and operates Group 3 FAX Service Class 2 (EIA/TIA 592) only. Use only the dates and times specified. FAX Service Class 1 (EIA/TIA 578) is availble upon request by leaving a message to the Sysop on BARF-80 BBS. The FAX card is sharing the same phone line as BARF-80 BBS using a data/fax/phone switch.

Excerpts and distribution of The OPDX Bulletin are granted as long as OPDX/BARF80 receive credit. To contribute DX info, call BARF-80 BBS online at 216-237-8208 14400/9600/2400/1200/300 and leave a message with the Sysop or send InterNet Mail to: aq474@cleveland.freenet.edu or send BitNet Mail to: aq474%cleveland.freenet@cunyvm or send PRODIGY Mail to: DFJH48A or send a message via packet to KB8NW @ WA8BXN.OH.USA.NA

mellerso@uga.cc.uga.edu (Mike Ellerson) writes:

>Has anyone had any experience with the [Entry Level] HF rigs like the :
>Kenwood TS 140S
>Yaseu FT747GX
>Icom 725 and 728

Well, I wouldn't call these ``entry level'' as such, unless you mean entry level in terms of expensive rigs.... To me, an entry level HF rig is most likely going to be tube based, such as an old Collins, Drake, Griefkit (even now, with a TS-140S here, I'd love to get my hands on an old HW-101), a Galaxy V Mk III (my old HF rig), and so on. Now *THESE* are entry level (prices range from free, or 25 cents like I paid for the Galaxy, to maybe as high as $100 if someone has just done a total overhaul on it).

When I went to buy an HF rig, the store I bought it at was very heavily biased toward Icom (to the point that they didn't try to sell anything else...you had to ask, and then they tried to talk you out of it), so when I asked about cheap HF rigs, they pointed me to the Icom 725 (I think it was the 725). They said that was the only cheap one they had, and I bought it. It didn't work...seems that sometimes, when I'd key down, the rig would just shut down, and I had to kill power all the way from the power supply for about a minute before it would reset and come on again. Of course, it didn't do this all the time...that would be too easy. It would work for a while (just long enough to get into a QSO), and then die. Thermal? Could be, the Icom I'd had before that had severe thermal problems.

So, I took it back, and the store (reluctantly) replaced it. Got the new one home, and it had a whole section of the VFO that was dead.

So, I took it back, too, and this time, I noticed this nice little Kenwood sitting there. Now, I've always been a Kenwood person, and Kenwood rigs have never failed me, so I traded the Icom for a Kenwood TS-140S. No problems at all. It's a nice little performer, does a great job on AMTOR and PacTOR (without any apparent problems with the T/R switch), and so on.

If anything, I'd like to add some external filtering (notch, variable bandpass, a separate lo-pass and hi-pass, etc.). I've had the parts on hand to build the filter for months, but haven't done it yet. :-) With a little time, I should be able to get a pretty substantial amount of filtering, just like the more expensive rigs have (ok, not including the new DSP stuff), and it will have only cost me around $40 (for the deluxe version).

On a side note: what would be the effects on AMTOR and PacTOR of the above filters? I'm mainly concerned about distorting the digital signal patterns to a point where the filtering is doing more harm than good. Any suggestions? Of course, PacTOR is so bulletproof that I probably won't ever need filtering there, but still....

>Also, how important is the FM mode which the FT747GX and
>Icom 725 and 728 omit?

You'll have to decide that one for yourself. All I can say is, I paid about the same price for the Kenwood, and I got FM mode. I haven't used it, but then, I prefer AMTOR/PacTOR over voice, any day.

>Is it worth paying extra for 6M on the Icom 729 and Kenwood TS690 ?

Again, you'll have to decide that.

Hope this helps.

Does anyone out there know the FCC rules governing the identification of commercial broadcast radio stations?

There is a new station in Detroit that NEVER gives its callsign.

Thanks.

>like it might do it - will it? I do have a 5 Amp regulated 13.8 VDC supply,
>but at 6-7 lbs it's not too portable ;-) Thanks...
>
I use got one of those 12VDC 1Amp supplies from Radio Shlock, it doesn't seem to complain about my FT530 which wants 1.5Amps at full power...for short transmissions. However, nobody can hear me over the 60Hz hum that I get from using the supply. But, I can work packet at 0.5Watts and the 60Hz hum is low enough that it doesn't inteferr. So, I get buy with that.

I have the Radio Shlock 3Amp supply when I want to more power, too bad mine got dropped a while back and it shorts out if I look at it the wrong way.

If you slip a capacitor inline on the 1Amp supply, it'll probably work. I've been thinking about giving this a try sometime. But, the 10' lighter extension cord that I'm using in the living room gives me enough walk around room. And, the when I'm doing packet I have the copper cactus hooked up, etc.

Source record: 280401

Steve,

Sorry, to send this public to all but that is my ownly option on the
BBS. Hope this gets to you!

I'm not sure if you are looking for an antenna to use with your balloon
package or if you are using the balloon to test antennas. I will assume
the former.

It would be my suggestion to use an "upside down" quarter wave antenna
with the radials pointing at 45 degrees into space. This would give you
probably the best radiation pattern for your purpose. The pattern
should be approximately hemispherical toward the earth with good
coverage to the horizon as well as directly below. The J-pole and
vertical dipole would not be as good directly below.
As for the balun, the quarter wave antenna will nicely match the 50 ohm
coax and the balun would not be required.

I would be interested in further details. Please reply via below. You
can netmail me, incoming get thru.

Hope this helps,

True. I remember a story in Readers' Digest about an ornithologist who
was thoroughly enjoying a movie until about the middle, when he heard the
call of a bird that never existed on the continent on which the movie was
supposedly being filmed.
I have a tendency, though, to be aggravated when I notice the talkies,
or a wound changing sides, or people stopping a car from high speed using
only their emergency brake (ever try that one? Be sure you're nowhere near
any other vehicles!). Ever notice that autos rarely have an inside rear-view
mirror in the movies or on TV? (The one in the bad guys' car in "Out For
Justice" had something wired to the back of it; anyone get a good look?
Antenna? Microphone? Constrampulator?)
And there's always the cop using his rubber duck inside the car...
ARRRRRGH!

>I'm sorry - I guess I missed where _Motorola_ bought spectrum hams were using.
>Perhaps Mr. Sharp in his infinite wisdom (the way he "figgers" it) could point
>us to some facts to accompany his sarcastic backstab of Motorola.

Now, now. I prefer to think of it as irony (though sarcasm means just about the same thing :-). And that wasn't meant as a stab at Motorola per se, I just didn't want to fill up an article with dozens of names.
It's been discussed to death in various places that, if selling frequencies becomes common, that companies like Motorola, Drake, Northrop, E. F. Johnson (am I dating myself with these names?), would easily be able to outbid a bunch of hams. If, for example, 222-225 MHz went on the block, I'm sure any number of cash-rich bidders would show up and so outrageously outbid any consortium of hams that the remaining piece of that band would be long gone very soon. If we managed to get together a million, it would take two seconds for, say, Northrop to show up with two (to use the area for telemetry, say), and another two secs for Motorola to show up with three (for PCS or something). There was a _rumor_ some time back that 220-222 MHz was looking pretty good to Motorola, in fact (RUMOR ALERT: I'm not at all sure how true that might be). We hams do have quite a bit of bandspace on allocation secondary to US Gov't use, and if the USG loses that there's a real good chance that we won't have secondary use there any more. And wasn't there recently a petition or NPRM about moving the 40M band to accommodate SW broadcasters (thus obsoleting literally millions of dollars worth of privately-owned equipment)?

I certainly wish you'd have taken the smilie for what it was meant to be and taken the whole thing with a grain of salt. My apologies if what I said was taken as an "ad corporationem" (???) attack, rather than the generic

statement it was meant to be.

>Speaking purely as a concerned ham - not for Motorola or the industry.

Taken as such. Again, I couldn't even fault Motorola, OR the industry,
for taking advantage of such a situation; bandspace is getting increasingly
rare, and he who holds it owns a great deal. I just feel that we have to
do whatever we need to do to try to keep corporate fingers (ALL of them)
out of the ham bands.

From: dts@banyan.com
Message-ID: <C8oK7C.1ML@squam.banyan.com>
Source record: 280380

6 Meter Band
Weak signal layout

50.0000 - 50.0800 Beacons, etc. (DO LISTEN HERE!!!!)
50.0800 - 50.1000 CW Only
50.1000 - 50.1250 DX Window
50.1250 - 50.4000 general SSB activity
50.4000 - ??? AM Activity

Generally, leave your dial around 50.125. That's the calling frequency. Don't go into the DX window unless you are calling for DX or answering a DX CQ. How do you know to go into the DX window and call DX (assuming evreything is pretty quiet)? When you hear one of the beacons. There is a beacon in Greenland that I have heard, but so far I have not worked any DX myself.

During contests you will hear people in the CW portion, and most everyone else will be in 50.125 to 50.200. This past weekend there were so many stations that people were spread all the way up to 50.300. We worked south florida for the first time. I got 3 or 4 grids in florida, and I think faith got 2 or 3.

Good luck on 6 meters... see you in the Es openings!

The FT890 is well worth the extra money over the entry level rigs above. At the level of the 890 and the TS450 things like keyers and SWR meters start showing up in the rigs, as do auto tuners. By the time you add up these needed accessories and add them to the entry level rigs, you'd be better off spending the extra bucks up front.

|> with any of these rigs. In the entry level class all these units are fairly
|> close in features. Also, how important is the FM mode which the FT747GX and
|> Icom 725 and 728 omit? Is it worth paying extra for 6M on the Icom 729 and

I have an IC-726, the predecessor to the IC-729. We also just got an IC-575H 6 meter all mode. The 726 does not have the best receive for 6 meters, which is something of an understatement. I am not sure what the preamp in the 726 was targetted for, but it really generates more noise than it's worth, much of the time.

The Kenwood 690 does have the advantage of 50 watts on 6 meters instead of 10 watts from the Icom HF+6 rigs.

|> Kenwood TS690 ? Do any of these units have a better receiver section than
|> the other ? Any features more valuable than others ? Any information would
|> be appreciated.
|>
|>
|>
|> Thanks in Advance

I have a personal bias against Kenwood. Generally I recommend Yaesu for HF and Icom for VHF/UHF. The FT890 is EASILY the best compact rig I have ever worked with. I own its big brother, the 990, but would love to have an 890 in the mobile.

> Collins it is a toll call and I can see the antenna(s) from my home.
> :-(

This is a call to the NIST office in Boulder, CO - which is where the clocks really are. The WWV site in Ft. Collins has just the transmitters; there's a microwave link between the two. (And I've been told that the transmisssions are corrected for the ~50 mile trip from NIST to WWV, such that listeners can assume the WWV site as "ground zero" when shooting for the ultimate degree of accuracy! May be an urban legend, but it sounds good....)

Not as long as the antenna is mounted far enough away from the Really Big
Ground (i.e., the planet in question) so that it's not a problem. For a
2m antenna, getting several wavelengths off The Ground is usually pretty easy.

Well, if you feel like improvising, and your rig can transmit either
FM or full-carrier AM, there is the method of tapping out code on the
microphone PTT!

Gee, I wonder if whistling a pure tone into the mike on SSB would
be effective. I might have to try that sometime!

YAESU FT-530
(from Yaesu Service Dept.)

Expanded Receive 110-180, 300-500 MHz[, 800-950 MHz]
[Transmit 140-150, 430-450 MHz]

o Remove Antenna and Battery.
o Remove four screws on bottom holding battery track.
o Remove the four (black) screws holding rear case.
o Slowly... open the front cover from tranceiver and lay both halves on table.
o Note positioning of white paper insulator in right half of radio and lift out
(don't throw away)
o Carefully locate Jumper Pad 13 and remove solder.
o Carefully locate Jumper Pad 15 and remove solder or 0 Ohm chip resistor.
o Re-install white paper insulator, make sure ground tab slides through the
paper insulator.
o Close radio back up (Careful not to pinch the ribbon cable near lithium
battery when closing halves).
o Re-install the four (black) screws holding rear case.
o Re-install the four (small silver) screws on bottom holding battery track to
radio body.
o Attach Antenna and Battery.
o Turn off Radio.... Press and hold both arrow keys while turning on the Radio.
o Modification Complete.

>He says "they're losing the technology", i.e. the hams of today are
>SO STUPID, (UNEDUCATED) that all they can do is "go buy a box and
>hook it up, so they don't have to think".

It is probably true. I assert that this is ONE inevitable result of
publishing all the test questions. Some might argue about no-code Tech
tickets being a contributing factor but I disagree.

It was originally neccessary for each prospective ham to actually learn a
certain level of electronics to prepare for a particular test. You actually
had to learn it all as best you could.
"Cramming" the test questions is too easy a method for most
people,(including me), to forgo. Unless you already know electronics,
this does not prepare anyone to do much of anything BUT pass the test.
More liberalism at work? IE: It would't be fair if some candidates couldn't
pass the test. ^^^^

I learned all the material for the novice and tech ticket the hard way years
ago, (in the 9th grade, about 1966).
It took several weeks of 1 class a week for 4 hours. That's where I originally
learned basic electronics. When you finished the class you actually KNEW
something.

5 years later, I started a 2 year electronics program at the
community college. I could have skipped much of the first quarter entirely.
A good deal of the second quarter was familiar.

You don't get that "cramming" from a question manual.

I was no electronics expert, but I am concerned, (for the long term health of the ham fraternity), that I then knew far more technology than many of todays "cram study" licensees.

We may be seeing the results of the "dumbing down" of amateur radio operators to the lowest common denominator, just as we are seeing plummeting scores in the public school system.

My only thought on remedying the situation is to try to lead by example by being more educated ourselves.

I don't think publishing the question pool causes people to get stupid.
Yes, it does let less technologically educated people into the service.
But, there is more to the service than technology. What about the people
who are interested in health, safety, and emergency assistance, and not so
much interested in Yagi design? eh? Are we all supposed to specialize in
transmitter design? The tests test for nothing in the area of
digital protocols and new modulation methods; and those are THE
blossoming new fields (I think).

>More liberalism at work? IE: It would't be fair if some candidates couldn't
>pass the test. ^^^^

Some don't pass it!

>We may be seeing the results of the "dumbing down" of amateur radio operators

The "plummeting scores" is probably related more to the fact that almost all
parents work now, and don't have the time or energy to assist their
children. But then I guess we all know who would have to be to blame if
this were true -- don't we?

Gary Coffman (gary@ke4zv.uucp) wrote:
: If you were to open one of the expensive high voltage rectifier
: stacks that come potted in epoxy, you'd find that they're just
: ordinary diode strings that were carefully matched at the factory.
: You can do the same at home.

1N4007s-equivalents from Digi-Key come on a tape, so it's quite likely they are from the same batch. You get a generic 1N4007 for 10/$.77 with a 30 us recovery. The faster FR107 features 500 ns recovery at a cost of 10/$2.35.

This seems much cheaper/easier than the board of diodes/caps/resistors. The problem with resistors is they usually have a 350v max on them, so you end up putting three of them across a 1N4007 - that's more expensive than the diodes themselves. Ditto for the .01/1000v caps. The other bad thing is that the swamping resistors dissipate heat that can be transferred to the diodes, making matters worse. It's far cheaper to just string up three or four diodes to get the equivalent of a K2AW-style high voltage rectifier, so Gary's comments are interesting.

I observe that the on-to-off transition occurs at the top of the sine wave, where dv/dt is close to zero. The turnoff time for a 1N4007 is typically 30 uS. Now, the voltage at 30 uS beyond turnoff is nowhere near 1 KV - more likely around 50 volts for a 2 KV supply. The fastest diode in the chain will hold that.

Maybe someone can explain the rationale for the swamping resistors and transient capacitors to me. The explanation given in the ARRL Handbook doesn't go into detail - it just says you have to have them. Maybe we have better technology now than at the time the article was written.

[The following suddenly re-appeared on packet radio, from VK2XY,
after an absence of several weeks.]

DICK SMITH'S TRANS-CONTINENTAL BALLOON ATTEMPT:LIFT OFF IMMINENT

As this week's divisional news was prepared, Dick Smith and co-pilot
John Wallington were making ready for an expected launch from Carnarvon this
Sunday evening.

Stations seeking contact with the special event station supporting and
publicising the balloon crossing - VI2AUS should stand by on the bands.
This could be it.

VI2AUS will be operating from the Sydney Headquarters of Australian
Geographic Magazine in Terrey Hills.

Look out for the callsign on 20 metres in particular, but operation
is also scheduled for 80 metres, 40 metres, 30 metres and 15 metres.

The VI2AUS operation has been organised by the N.S.W. Division advertising
and publicity section; the team of volunteer operators is co-ordinated
by the division's special projects officer, Steve Pall, VK2PS.

Dick Smith Electronics has provided two Yaesu transceivers and other
equipment for the Terrey Hills station.

For an update on Dick Smith's attempt, you can get recorded information
from
0055 29 060

calls cost 25 cents for 42 seconds.

The message is generally updated each evening.

[NOTE: It is my understanding that the callsign actually used to
communicate with Dick will be VK2AWI; the last thing we need is
hordes of prefix-hunters descending upon us if things go wrong. DH]

VI2AUS AND WICEN

While the NSW Division fully appreciates the role WICEN plays in the
community and within the amateur radio fraternity, the VI2AUS special
event operation in support of the Australian Geographic/Dick Smith
Trans-continental Balloon Attempt has been mounted at the personal

invitation of Dick Smith to the Division, with the express view of publicising the hobby to the public at large and secondarily providing a publicity vehicle for the NSW Division of the WIA.

As such the VI2AUS operation is not an "emergency exercise", either officially or unofficially. It is not intended to be, even though there is to be certain scheduled communications between the balloon and the Terrey Hills station.

The involvement of volunteers, who may also be members of WICEN, to operate the special event station is welcomed. However, in order that there be no confusion in the minds of the public, or anyone else, the Divisional Council advises that such volunteers are NOT to wear WICEN uniforms, even though it has been broadcast that they are requested to wear them, with leave from the State Co-ordinator for WICEN.

To make matters perfectly clear, NO official or unofficial approach has been made to the Divisional Council by anyone from WICEN and the broadcasting of the request was not sanctioned by Council.

Council will no longer tolerate unwarranted interference with the conduct of the Division's broadcasts, or any official Divisional activities, by persons who have no official standing within the Institute.

Bob Lloyd-Jones VK2YEL
Divisional Secretary

[This WICEN message was not authorised by anyone from WICEN (NSW) Inc; furthermore at no time had WIA (NSW Division) indicated their intention to not cooperate with WICEN, nor had they replied to correspondence. DH]

WARNING OVER DUMPING OF LOW-STANDARD ELECTRICAL AND ELECTRONIC PRODUCTS

Australia is in danger of becoming a dumping ground for electrical and electronic equipment of European origin which will not meet stringent new standards requirements of the European Electrotechnical Commission - The E.E.C. - which come into force on the First of January 1996.

The Australian Electrical and Electronic Manufacturers' Association warned of this possibility in their June newsletter.

The E.E.C. set the date of 1 January 1996 for the new maximum emission requirements to apply to electromagnetic interference - E.M.I. - from electrical and electronic products manufactured or sold in Europe after that date.

Here, the local standard authority - Standards Australia - had made no decision as of June on the question of E.M.I. requirements for such products and the Federal Government's Department of Industry Technology and Regional Development "...has yet to formulate a position," according to the newsletter report.

"There is a risk that if the matter is allowed to drift, an unreasonable timetable for compliance with requirements similar to that imposed by the E.E.C. might be introduced if Australia adopts the same introduction date," says the newsletter.

"Alternatively, if Australia is out of step with the E.E.C. process, the Australian market could become the dumping ground for products that no longer comply with the European requirements." said the report.

The Australian Electrical and Electronic Manufacturers' Association believes that Australia should adopt the same date for E.M.I. compliance for electrical and electronic products manufactured or sold here - that is, 1st January 1996. They are to take up the matter with the relevant Government departments.

AUSTRALIA TOPS 35TH J.O.T.A. PARTICIPATION

With 18.8% of scouts in the country taking part in the 35th Jamboree of the Air last October, Australia scored the highest participation rate among the 23 countries who submitted reports to the world organization of the scout movement.

The Netherlands were close behind Australia, with 14.2% of their scouts participating. However, 17.9% of the guides in the Netherlands took part in last year's J.O.T.A., while 9.9% of Australia's guides participated.

A total of over 400,000 scouts and guides from around the world took part.

- From the International Jota Report 1992, from Peter VK6HU

WIA TO PARTICIPATE IN RADIOCOMMUNICATIONS STANDARDS PREPARATION

Four committees to prepare standards on rediocommunications equipment are being established by the national standards body, Standards Australia, under recent arrangements with the Department of Transport & Communications.

As a member of Standards Australia, the W.I.A. is seeking to participate in the committee processes.

A committee to be called R.C.1. will look at general radiocommunications equipment standards.

Committee R.C.2 will look at standards in the field of satellite and telecommunications networks; R.C.3. will cover low power radiocommunications equipment, and R.C.4. will cover maritime and safety of life equipment.

The committees will be making recommendations on the legislative application of the standards they prepare.

THE LAST LAUGH

It seems that a humorous item on the Broadcast of 11th April has been taken seriously by some amateurs and clubs around the country.

The item concerned discussed how amateurs were able to "GET BACK" the 11 Metre band - 27 MHz.

Despite the fact that the advice was - basically - go and buy a CB Licence, the humorous furphy has been taken as fact and even printed as a "known truth" in a VK3 club newsletter.

No - the much-touted "New Regulations" will not hand back 27 MHz to the amateur radio service.

But, then again, stranger things have happened in the recent past......

- The N.S.W. Division brings you this news as a public nonsense!

CONTEST NEWS

VK NOVICE CONTEST - NEXT WEEKEND

O.K. all you novices and combined-call licensees - time to polish up the vocal chords and the morse key contacts - for next weekend's W.I.A. VK Novice Contest.

The fun begins at 0800 U.T.C. Saturday, 19th June and continues furiously until 0800 U.T.C. Sunday, the 20th.

Rules for the contest can be found in the May issue of Amateur Radio Magazine.

- From information supplied by
Rob Milliken VK2SRM, Novice Contest Manager

WICEN NEWS

[This is all there was; it is not clear whether this is one of VK2XY's little jokes. DH]

CLUB NEWS

Firstly, we have a call to all club education or examination officers, and individuals who conduct license exams.

To assist candidates wishing to sit for examinations, the Division wishes to compile a register of examination dates.

If you could please contact the Divisional office by letter of fax, giving details of scheduled exam dates and times, and deadlines for applications, plus your contact names, addresses and phone numbers.

write to: P.O. Box 1066, Parramatta NSW 2124

or fax: (02) 633 1525

and while we're on the subject of education and examinations, we have a reminder that the St. George Amateur Radio Society is hosting a seminar on the subject at the
St. George Masonic Club
86 Roberts Road, Mortdale

on July the 4th.

It will open at 1400 hours and conclude no later than 1700 hours.

The purpose is to meet others who are interested in this part of our hobby and discuss how we each approach the task.

We may be able to assist one another in either exams or education.

If you are part of a team, or teach at home, you are most welcome.

Contact: Peter Corkeron, VK2AGB, on:

Home Phone Number (02) 521 6482
Work Phone Number (02) 529 6778, Mon-Wed-Fri
or Mobile 018 412 629

HORNSBY AND DISTRICT AMATEUR RADIO CLUB

The club meets on the 4th Tuesday of each month, at the Mt Colah Community Hall, Mt Colah, commencing at 8 pm.

The business side of meetings are kept short to get on with what everyone is there for - amateur radio.

A new program of events is currently being planned, so if you have a topic you would like to see presented as a lecture, please let anyone on the committee know.

New members welcome. Contact the club via

P.O. Box 362, Hornsby 2077.

- From Colin, VK2JCC

PARRAMATTA AMATEUR RADIO CLUB

The club's last meeting on the 4th of June was a huge success, with many new enthusiasts discovering the links between the worlds of electronics, computers and amateur radio.

Members and visitors alike shared with each other the practical methods used for electronic construction, ranging from professional methods to the simplest and cheapest suitable for home use.

Next meeting, on Friday the 18th, will be a kit building night. Bring your project - working or not - see what help you can get. There will be experienced people available to either fix your project or offer some assistance to solve your problems.

Bring some hand tools and test gear, if you can. An interesting night is assured.

That's Friday, 18th June, 7.00 pm at Amateur Radio House, 109 Wigram st, Parramatta. Coffee provided.

- from Garry Carter, Program Co-ordinator,
Parramatta Amateur Radio Club

COMING EVENTS

Saturday, June 19th:

VK novice contest commences 0800 U.T.C., concluding
0800 U.T.C. on Sunday, 20th.

Sunday, June 20th:

Wicen supports the Lake Macquarie Half Marathon.
Alan VK2KVF is the contact.

Sunday, June 27th:

Wicen exercise - The Eloura Fun Run; contact Kevin VK2CKD;
and the St Albans Horse Enduro - Contact unknown.

The next Divisional Council meeting is scheduled for Friday, June 18th. It well be held in-camera. Councillors only. It gets awfully stuffy in there with any more people in that camera!

Sunday, July 25th:

Divisional Trash & Treasure Sale.

Saturday, August 7th:

Tamworth Amateur Radio Club examinations; note that
applications close on July 15.

The August quarterly divisional examinations will be held on Sunday, the 29th of August. Applications close on Thursday, 12th August.

Finally, Steve VK2QZ advises that the July-September broadcast roster will be drawn up shortly and asks that all broadcast team members notify him of any dates you're unavailable.

3585. ZL policy on Morse Code

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-16 01:42:44 UTC
From: dave@esi.COM.AU
Message-ID: <4074@eram.esi.COM.AU>
Source record: 280398

This little snippet appeared on packet radio, and is presented
here for your information. Followups are directed to *.policy.

From: ZL2CA @ ZL2WA

VIEWS FROM THE NEW ZEALAND GOVERNMENT ON MANDATORY MORSE CODE
TESTING IN THE AMATEUR SERVICE

The Honourable Maurice Williamson, Minister of Communications for
the Government of New Zealand released statements regarding
International Radio Regulation 2735. RR2735 is the regulation
that requires amateurs to qualify with Morse code to obtain a
licence to operate on frequencies below 30 MHz.

The following excerpts of significance are quoted from the
Minister's reply:

* "I believe that the continued presence of RR2735 in the
International Radio Regulations, with its associated treaty
status, is now anachronistic."

* "The next opportunity to consider this matter at the
international level may be a World Radiocommunication
Conference in late 1995 .... ."

It is good to see an official statement that mandatory Morse code
testing of amateurs is out-of-time. The statements show scope
for realistic changes to occur, and in a realistic timescale.

In these days of 'politcal correctness' I really must take you to task for describing your wireless as a "WWII Nazi Field Radio".

Whilst I'm sure lots of wireless equipment was used by members of the Nazi party during this time frame I can assure you that the majority of the conscripted German forces were not members of the Nazi party.

As is usual in times of war the average soldier, airman or sailor is but a mere pawn of the political despots and although I have no reason to defend or condone any activities undertaken by the german forces I do not believe we should label them all "Nazi's" or infer such.

My immediate family has long since come to terms with the atrocieties inflicted on them in the war and although we've not forgotten we've definately not forgiven!.

My apologies for the soap box but we Europeans are funny about these things

>field day. I am in need of information on what frequencies I should use.
>The following equipment is available to me:
> 6m All Mode
> 2m All Mode
> 220 FM
> 440 FM (All Mode when no satelite around)

On 6 meters, try 50.100 up to 50.200, but pay most attention to the
area around 50.125 - 50.150. It will be all USB/CW. I'm not sure
where the FM activity occurs although according to the ARRL band plan
it's 52.02 - 52.04 MHz

On 2 meters, try 144.100 up to 144.300, but pay most attention to the
area around 144.150 - 144.250. It will be all USB/CW. For FM, try
any of the normal FM simplex frequencies in the range of 146.40 -
146.58 avoiding 146.52 MHz.

On 220 most activity in the Chicago area during VHF/UHF contests occurs on
223.500 MHz and is FM. Can't say what it's like in the Seatac area or
on USB/CW although the ARRL band plan says 222.100 MHz is the SSB
calling frequency.

440 FM simplex is usually 446.000 MHz.

Good luck and hopefully you'll get some *good* propogation on the best bands!

| wriggle through a small opening (i.e. less than 1/2 wavelength in any
| dimension)?

I don't know; this is something I need to work on further. I recall
wriggling through a fairly small slot, but I was in no position to
estimate its dimensions; I was too busy keeping the HT out of the
*&!@#$ grit :-)

When I get reproducible results I'll write it up for "Speleonics".

3593. DR-600T/TH-78A mods?

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-16 03:11:25 UTC
From: kevin@bap.ucsb.edu
Message-ID: <kevin.740200285@bap>
Source record: 280419

Hello all! I'm seeking information and clarification:

1) Anyone have modifications for the Alinco DR-600T?
The schematic appears to be a slightly modified DR-599, so mods
for that radio are also quite welcome.

2) I tried the "remove diodes 4 and 5" mod on my Kenwood TH-78A, but
did not get extended transmit (into a dummy load, of course).
Extended receive is working. Has anyone else experienced this?
Aware of a way out of this?

Thanks for any and all replies. I'd be happy to summarize and post (or
email) the fruits of any replies, if requested.

>>He says "they're losing the technology", i.e. the hams of today are
>>SO STUPID, (UNEDUCATED) that all they can do is "go buy a box and
>>hook it up, so they don't have to think".

This is trully wonderful. The "J-slot" must I assume be the
J-Beam skeleton slot. Made in the U.K., Very popular over 20 years
ago. With two getting a one meter wide beam? Really?

The skeleton slot was no more than a pair of stacked Yagis. It
was fed with an arrangement called a "skeleton slot". It was usually a
pair of 6 or 8 ele Yagis.

We haven't "lost technology". All you need to know about the
J-Beam skeleton slot is available in old handbooks from both the RSGB
and ARRL.

And what did these guys do 20 years ago? Well they "go buy a
box and hook it up so they don't have to think". Yes, you purchased
J-Beam Yagis, just like you purchase Cushcraft and KLM today. Nothing
has changed. Nothing magical happened 20 years ago.

So what about the above is suspicious? 1. claiming the J-Beam
was made in California. 2. Claiming 2 J-Beams with give a beamwidth of
36" (not stating at what point - two meters in front or two hundred
kilometers). 3. Amateurs doing antenna computer modelling 2o years
ago.

Looks like an urban legend in the making to me.

>
>Yes, but the detector has to be electronic. Using the Mk I eyeball
>doesn't qualify.

No, I don't see any such rule about electronic detection in the
FD rules, though they are a fixture in the VHF contest rules.
The usual problem for most people is the coherant radiation
requirement (search lights are still cheaper and easier to use
than lasers for short distances). Don't know whether its more
impressive to do a laser contact during the day or wait till
night-time.

As normally used by contestors, the term "multiplier" really
doesn't apply. It often refers to a grid square/state/country
on separate bands. You tally these up and "multiply" them against
a contact total. Except in Field Day, which has a contact total,
power multiplier, and bonus points.

Still working on my VHF contest logs--what a mess with all the
E skip and band changes. Sure beats flat conditions, though.

>
>And exactly *where* in the rules does it say that? Part 97.113(d)
>flatly prohibits the transmission of music. It does not specify a
>modulation encoding. This part deals strictly with content, and
>not the method used to convey that content.

Good analysis IFF part 97 was the only word on the subject. But it's
not. I believe the ARRL has already asked for guidance on the regulation
and have been told that "music" in that regulation means, as any
rational person would expect, music as you hear it in the broadcast
band. It does not mean other methods of representing music and does not
mean music picked up in the background when public service operators are
working a parade or music incidentally picked up from your car radio
when you're talking on the repeater.

It is common, and in fact required, that regulatory bodies give
interpretation of their regulations those interpretations aren't as
binding as the regulations themselves, but they are binding to a lesser
extent and can be depended upon for day-to-day operation.

So give the armchair lawyer act a break.

Well you'd hope so Brian. However, we used to play music over the
ID slide during the warm up period for our transmitter at sign on.
We were cited. The commission said we weren't licensed as a radio
station and couldn't play music without accompanying *moving*
video. So I wouldn't be so sure that they use good judgement
in interpreting the rules.

Yes, I'd go for a bigger than a car antenna, wire, say a few tens of feet, a length of ordinary 50 ohm RG58 with a terminating resistor at the end connected directly to the car radio.

I was just worried that someone might stick up a car antenna and extend its cable with RG58 equiv. a long way to the radio and then find the result rather disappointing, blaming you. I assumed it was just an oversight not adding a note of caution, you don't often miss this sort of trick. Car radios are quite excellent, and it is easy to do better than a car antenna at home.

Have you got RDS-EON going anywhere in the US yet ? I've had it working in my Range-Rover for the past year using a double front-ended rx that seamlessly changes freq to follow a chosen network as I drive around Britain, it will also identify emergency or traffic announcements and interrupt other stations, tape or silence, whichever is selected at the time. One less well known thing is that the transmitters also have programme type data fields eg "Rock" "Classical" "Sport" "News" etc etc and I can set it to scan by type.
It may be that the nature of the organisation of US broadcasting makes this a European curiosity.

Cheers
David

both 2m and 70cm receive are active, you change bands with the "BAND" button. This swaps the left and right displays. When dual in-band receive is active, the "BAND" button changes both the main and sub receivers from 2m to 440 or from 440 to 2m. Arrrgh!!!! I would prefer a "SWAP" button to swap left and right regardless of mode. (The "SUB" button is used instead.)

Automatic backlight dim: works as advertised but the backlight level under low ambient lighting is WAY too low. Manual control is the best solution.

DTMF page: works as advertized, but the *&%$#@ thing insists on "ringing" like a phone EVERY time it receives the page sequence. This means that you have to co-ordinate with the other station to turn the *&%$#@ DTMF stuff off at the same time or tolerate the "ring" at the start of every receive.

CTCSS decode: squelch opens quickly when normal CTCSS decode (an option) is enabled. There is a CTCSS page function that has a distinct delay between receipt of carrier with CTCSS and open squelch. I don't yet understand the use of this "feature."

There is no SCAN button on the front panel. Scan is initiated by holding the up or down button of the mike down for two seconds. The scan is blindingly fast when compared to the Alinco 590 that I used to have.

Memory: memory is divided into four "banks." Two for VHF, two for UHF. Only one bank can be active for each receiver. I consider this an advantage, but you may not. There are two obvious (to me) uses for this configuration. First, you can store frequencies for different uses in different banks. Second, you can activate one 2m(440) bank in the main receiver and one the other 2m(440) bank in the other receiver and scan them simultaneously.

Heat management: After seeing the HUGE heat sink on the back of the Alinco 590, the Yaesu 5100's sink seems too small. In a key down experiment, the heat sink of the Yaesu got almost too hot to touch before the fan kicked on. If I were planning to run a packet station, I would definitely look into some extra forced air over the back of this one. As it is, I'm a bit concerned about how hot it will get mounted in my dashboard. [Others people don't seem to have this problem.]

DTMF Decode and Scan: If you have CTCSS decode (an option) enabled on a memory and you are scanning and there is activity on that frequency but without the correct CTCSS tone, the 5100 stops scan, flashes the strength meter and then continues scanning. It is slower than normal scan, but still quite fast.

[ed] The implications of this are that the entire radio can be controlled via the microphone port! Too bad there isn't a fancy *wired* mike with all the controls on it.

Several people have reported trouble with the mike -- enough trouble for them to return it because of poor range and poor audio. It works well if you sit on top of the pickup unit, but then you don't need a wireless mike.

Attributed: Tony Pelliccio, KD1NR system@garlic.sbs.com

-=-=-=

6) On the rear of the Control head locate, Unsolder and remove
jumper Pad R4072.
7) Solder across jumper pads: R4070 R4068 & R4064 (use wire or
0 Ohm resistor)

NOTE If you want to change the D/MR button on the
microphone to do Band Switching, now is the time.
See the next mod.

8) Install front control head, speaker, top and bottom covers
and reconnect power to the radio.
9) Press and hold [D/MR] [F/W] [REV] keys and turn on the radio.
Radio will now show 300.000 & 20.000 on display.
10) Set UHF Rx Low - Press [MHz] and dial 420.00, press [D/MR]
11) Set UHF Rx High- Press [MHz] and dial 475.00, press [D/MR]
12) Set UHF Tx Low - Press [MHz] and dial 420.00, press [D/MR]
13) Set UHF Tx High- Press [MHz] and dial 450.00, press [D/MR]
14) Set VHF Rx Low - Press [MHz] and dial 128.00, press [D/MR]
15) Set VHF Rx High- Press [MHz] and dial 180.00, press [D/MR]
16) Set VHF Tx Low - Press [MHz] and dial 140.00, press [D/MR]
17) Set VHF Tx High- Press [MHz] and dial 150.00, press [D/MR]
18) Set UHF offset - Press [F/W] then [RPT] dial 5.000 press [RPT]
19) Set UHF tuning - Press [F/W] then [REV] dial 25.0 press [RPT]
20) Set VHF offset - Press [F/W] then [RPT] dial 0.600 press [RPT]
19) Set VHF tuning - Press [F/W] then [REV] dial 20.0 press [RPT]
(VHF tuning step varies by state -- many use 15.0)

Diagram: [there are no tabs in this section - ed]

Ok, here's where it gets tricky, but so you know, a '|'
represents a jumper.

g7ltq@g7ltq.ampr.org

-=-=-=

1) Close (short) JP5001, JP5002, JP5003, JP5006 and JP5007
2) Remove (open) JP5004 and JP5005

The frequency range possible will now be approximately :
VHF Rx 110 - 180 MHz Tx 130 - 180 MHz
UHF Rx 330 - 480 MHz Tx 425 - 465 Mhz

The radio's alignment was done at the factory for your original frequency bands and so there will not be optimum behavior outside these ranges. Broadening the alignment will sacrifice performance at usual frequencies. In practice, the alignment does not need adjustment.

You can program the frequency limits now. [ed - note the similarity (and dissimilarity!) to the 5100's program-limit sequence above]

3) Press and hold [D/MR] [F/W] [REV] keys and turn radio on.
4) Program in VHF low edge of Rx
VHF high edge of Rx
VHF low edge of Tx
VHF high edge of Tx
5) Repeat for UHF in the same order.

I [John] have not done this so I can give no further advice on programming.

Attributed: John Newgas, G7LTQ jnewgas@cix.compulink.co.uk
g7ltq@g7ltq.ampr.org

-=-=-=

pin pcb connector is oriented. [ed -- does it matter?]
3) Remove two side screws holding on the front of the chassis and remove chassis front. (The chassis front is the surface with the contacts for the control head.)
4) Locate a double row of ten by two jumper spots, numbered 1 to 20. The jumper configurations will depend on the area for which the rig was intended. Note the arrangement if you ever want to un-modify your radio.
5) Using a fine-tip soldering iron, set the jumper spots as follows:

1 closed
2 closed
3 closed
4 open
5 closed
6 closed
7 closed

6) This completes the alteration for frequency expansion. Reassemble the radio.
7) Reinitialise the radio by simultaneously holding D/MR, F/W, REV and POWER. You must now program in the band limits. The display will show a blinking "1" in the left-hand memory box and "000.000" in the left-hand frequency display. (Ignore the right-hand display for now). The following limits are suggested, but the RF circuitry of the rig will only cover slightly less. Use the dial or up/down buttons to select the frequency and then press D/MR to store it. The blinking "1" will increment.

VHF rx: 137.000 174.000
VHF tx: 137.000 174.000
(display will show blinking "1" and "300.000")
UHF rx: 410.000 470.000
UHF tx: 410.000 470.000

(Note: it is possible to set the RX limits wider than the TX limits; for obvious reasons you cannot have the reverse situation).
8) You can repeat step 7 above at any time if you need to change the limits.
9) The pre-set repeater offsets are now no longer available and you will have to set them up manually using the instructions on page 16 of the manual. The Automatic Repeater Shift (ARS) feature (also on page 16 of the manual) will also have disappeared and you will have no way of getting it back (except by changing the jumpers back).

To enable the crossband repeat, remove the link at jumper spot 17. (Note, just below jumper spot 17 is a separate jumper spot, not part of the group of twenty -

leave this alone).

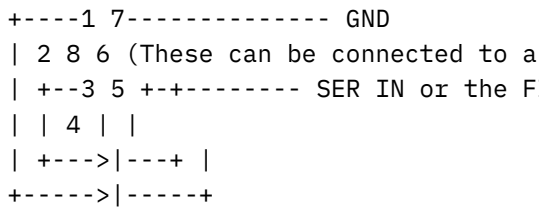
buttons are still active.

The commands are as follows:

0 - RPT 12 - CALL 24 - SQL Up
2 - REV 14 - BAND 26 - VOL Up
4 - MHZ 16 - RMC 28 - BAL Right
6 - D/MR 18 - SUB 30 - BAL Left
8 - TONE 20 - PAGE 32 - SQL Down
10 - LOW 22 - F/W 33 - VOL Down

The interface I built simply wired mike port pin 7 to serial ground and pins 1 and 3 each through a diode then together, to the serial source. Note: I am not a hardware person! Use this hardware at your own risk.



You can wire 1 and 3 together first, then through 1 diode, but that disables the UP and DOWN buttons.

I'll continue to study this more. If anyone would like to know more, or has any corrections or feedback, please email me.

>transient capacitors to me. The explanation given in the ARRL Handbook
>doesn't go into detail - it just says you have to have them. Maybe we
>have better technology now than at the time the article was written.

The resistors swamp out the differences in reverse leakage of the diodes. Without the resistors, the diode string forms a voltage divider with the voltage across each device proportional to it's reverse leakage resistance. Thus the best diode gets the most voltage dropped across it. With the swamping resistors being lower in value than any expected reverse leakage, this tendency is removed.

Example, suppose there are two diodes in a leg. One has 100 Megohm leakage, and the other has 200 Megohm leakage. The latter, a better diode, will have two thirds of the applied voltage across it while the other will only have one third. If the the peak inverse voltage rating of the diodes is 1,000 volts and the applied voltage is 2,000 volts, the good diode will have 1,333 volts across it and will fail. Now put 10 Megohm resistors across each diode. The leakage resistances will be swamped, and each will see 1,000 volts dropped across it.

As diodes have gotten better, the leakage resistance has gotten larger, but there's still considerable variation from unit to unit. If you have access to a high voltage leakage detector, you can match units so that the swamping resistors are unnecessary. Otherwise, you still need to use the resistors.

A similar thing happens with junction capacitance. A capacitive voltage divider is formed, and this time the diode with the lowest capacitance has the most voltage dropped across it. By putting larger capacitors across the diodes, this too can be swamped. The package inductance is usually so small it can be ignored at power line frequencies.

Yes Steve, you should be concerned about this. Having the feedline
parallel the radiator will induce antenna currents into it as well
as distorting the antenna pattern. You should use end fed antennas
for balloons.

Are there any netters out there in Florida, Alaska, or Idaho with 2x1, 1x2, or 2x2 "A" calls who would be willing to try a 75 meter phone sked in the extra-class portion of the band? That's all I need for the 75m WAS award, and the Geratol Net (which meets for that purpose) doesn't start up again until October. 'Course I know what the 20 over 9 background noise on 75m is like in the summer, but it wouldn't hurt to try anyway. And every once in awhile it gets quiet here in North Carolina.

Curiously, I'd use the same argument for the opposite opinion.

As has been said, many Germans opposed the Nazis, by fleeing the regime (and then fighting against it) or by opposing it in Germany (and then usually dying). What proportion of troops were compelled to fight against their wishes is unknown, but likely significant.

To refer to the perpetrators of WWII as "German" is unkind to these people. I think "Nazi" is exactly the right word to use.

PS: a certain major US company has a " Government" radio division. I expect their products are neither made nor used by members of the US government, although the US government did set in train their manufacture and use. It seems a usefully descriptive name.

All my own, finest, home-grown opinions,

David GM4ZNX

> The date of the database is July, 1992. I must admit that there is a
> coupon that I can send in $10 and get the one for November, 1992.
> 11/92 still seems a little old to be charging 39.95 + 10.00 + 3.00 (S&H).
> I shudda known better than to deal with Rat Shack!!!!!
Geez. You admit you didn't read the print. You went in the store and
bought it on impulse, and then feel the need to whine here that you
were somehow "taken"?

Get a life!
Betcha when you need a resistor or cap and it's just before closing
time at the Radio Shack, you call and ask them to stay...and they
probably do...so you can buy 99cents in parts to save your bacon and
then come back here to the 'Net to bitch about how over-priced RS is.

Yes, that is a lotta assumptions on my part, but the evidence from
your post was overwhelming... ;^)

Lighten up...and practice your reading, and your math. November 1992
data, accessible on a PC that takes up only 19MB (with all the bells
and whitsles installed) and is quick is a good deal for $39.95. If you
stop and think (flame on -- that part may be difficult for you --
flame off ;^) you are paying $39.95 for a great little program, and
ONLY $10.00 plus S&H for a new callbook every year! That's a helluva
deal and leave you nowhere to gripe! Sheeesh!

73

>Yes Steve, you should be concerned about this. Having the feedline
>parallel the radiator will induce antenna currents into it as well
>as distorting the antenna pattern. You should use end fed antennas
>for balloons.

I am planning to use an end feed 1/2 wave "balloon vertical" on 20 meters
for field day. I have tested its operation using a simple pi-network
matching circuit/tuner. Since I will be running only 5 watts I am able to
get away with using a small broadcast band type variable caps in the tuner.
The tuner is mounted to a short ground stake. The antenna wire goes to
the tuner input and the balloon tether line is tied to the ground stake.
A short coax runs from the tuner to the SWR bridge then a longer run of
coax along the ground to the radio.

I tried it in my backyard last weekend and seemed to work fine. I hope
it works as well at the beach on FD.

>On 6 meters, try 50.100 up to 50.200, but pay most attention to the
>area around 50.125 - 50.150. It will be all USB/CW.

Please remember that the Intercontinental DX window is from 50.100 to
50.125. I'm not a terribly active 6m op, but I understand that it is
considered tacky, poor taste, etc. to sit in that window calling CQ,
especially during a USA contest. I would recommend 50.125 as a low
boundary then go up as high as is practically needed, probably not
much more that 50.250 or if things are really busy, 50.300 or so...
(Let's hope the openings are so good that we need to go up as high
as 50.300!!)

I bought some flexible 9913-like cable from Cable Experts (see ads
in ham magazines). The loss and propogation velocity are the same
as Belden's 9913, but the Cable Experts stuff has a stranded center
conductor which makes it much easier to work with. Highly
recommended, if not inexpensive.

I think these two people are taking extreme views. I fall somewhere in between as probably does most every other ham. I am an atomic physicist, but I typically don't do atomic physics while on the radio. My main interest in amateur radio is emergency communications. I am currently using a license study guide to "cram" for an exam (I'm testing for element 4B tonight). If I'm going to do the "technology" thing, I'm going to need a stack of reference books, a computer, a couple of collegues, and a lot of telephone calls. So far, I haven't been to an exam session where the VEs would let me use that stuff. The people that are going to do "technology," will continue to do "technology." I feel that we are not losing "technology," we are gaining expertise in other areas (digital communications modes, etc.).

Just my opinion...

> view the file on a DOS system??

Marty-

I understand that the ".tar" files are Unix "tape archives". You need a utility program to un-archive them. If you have a friend with a Unix machine, it would be easy to do.

I'm not familiar with the MS-DOS utilities, since I'm operating a Macintosh. There is at least one Mac utility that recovers .tar files (MacTar?). The program I usually use, is Stuffit Deluxe, which has a .tar "translator".

Where is CHURCVR.TAR located? If I could get a copy and translate it, could I upload it to nadc.navy.mil?

After you get the file translated, you will still be faced with determining what graphics format the resulting file is in.

/*
The world is divided into fields. Fields are divided up into squares. Squares are divided into sub-squares.

Each field is 10 degrees N-S by 20 degrees E-W. Each field is indicated by a two (capital) letter identifier. The South-Western most field is AA. This field is actually a triangle, and it is located from the South Pole to 80 degrees South, and from 180 degrees West to 160 degrees west. The field directly north of AA is AB. The field directly north of AB is AC. The field directly east of AA is BA.

Each field has 100 squares. Each square is 1 degree N-S by 2 degrees E-W. Each square (inside it's respective field) is indicated by a 2 number identifier. The South-Western most square in a field is 00. The square just north of 00 is 01. The square just north of 01 is 02. The square just east of 00 is 10. The North-Eastern most square in a field is 99.

Each square has 576 sub-squares. Each sub-square is 2.5' N-S by 5' E-W. Each sub-square (inside it's respective field) is indicated by a two (lower-case) letter identifier. There are 24 x 24 sub-squares in each square. The South-Western most sub-square in a square is "aa". The sub-square just north of this is "ab". The sub-square just east of "aa" is "ba".

Actually, this *is* the politically correct usage. The idea is that the
Allies fought against the Nazis, not the Germans. The movie _Patton_, for
example, was dubbed in this manner before being shown on broadcast TV.

Yes that's the problem. We don't really have radio networks anymore in this country, other than some ad hoc things built around certain programs. Each station is programmed locally for it's local market. Local programming generates the most revenue. They may pick up some satellite programming, but even that often operates on tape delay. The days of full time national networks are long gone in radio, and are rapidly fading in broadcast TV. We have public TV and NPR, but they're sad things that don't appeal to wide audiences.

[complete description of the theory of the grid system omitted]

While that is a complete description of how the grid squares and
subsquares are laid out, a more practical chart may be found in my
favorite reference for this type of thing, THE ARRL OPERATING MANUAL.
Look in the chapter on VHF/UHF operating for a full page devoted to
the subject. It includes the usual coarse map plus cookbook tables to
allow you to determine your exact grid subsquare given your latitude
and longitude. It requires that you know this to the nearest minute
(or half-minute) which may require you to refer to a USGS topo map or
equivalent, since the 2.5' division in longitude is only about two and
a half miles.

>commercial broadcast radio stations?
>
>There is a new station in Detroit that NEVER gives its callsign.
>

That's okay. It'll only cost'em $8000 to have that privilege.

The reg. is once per hour. And the format is: freq, call, loc.
There are certain variants on that. Examples of an ID are:

97.7 KGCI-FM Grundy Center
or if there are two transmitters:
1190 KDAO Marshalltown and 99.5 KDAO-FM, Eldora.

The town has to be where the transmitter is. (Or control studio,
don't remember which.) In case this is a small town, you'll hear
something like:
97.7 KGCI-FM Grundy Center, Cedar Falls and Waterloo. Still the basic
legal ID, but w/ extra towns added on so people actually recognize what
state you're in.

3633. Advice needed on an ICOM32AT

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-16 17:26:22 UTC
From: yee@mipg.upenn.edu
Message-ID: <131631@netnews.upenn.edu>
Source record: 280450

I just bought an old ICOM 32AT. Along with the rapid charger (BC-35 ?),
a 13.2V ICOM battery (BP7) and a after market 13.2V battery, I paid $280.

It turns out that there are two minor problems with the rig and only on
two meters. First of all, there is a high pitched whine on the audio and
while warming up, the audio is highly distorted (especially in the region of
146.68MHz). After warming up with several minutes of transmit, the audio
is much better but the whine remains. The 440 band is fine. Transmit signal
reports on both bands are fine.

I have called ICOM up and they said it problems are probably due to a bad
crystal in the 2nd IF frequency and a bad cap in the PL. They said the cost
would be circa $90. I have looked at the rig and I do not trust my soldering
skills to make the repair myself.

I may have the choice to return the rig (not sure yet). Should I return the
rig or invest an additional $100? If I am unable to return the rig, I figure
on spending the $100 unless someone has a better solution.

I suspect you didn't challenge the citation - for most commercial operations, it isn't worth it for small things like that.

But I know that I'd definitely take any such citation up the ladder of review and hearing if I thought the FCC was being arbitrary or capricious, as is my right and my duty.

I do know of a few people who have indeed done just that - instead of just sending in the fine (excuse me, "monetary forfeiture"), and won.

In any case where the alleged "offense" is based on an unreasonable interpretation of the FCC regs, I'd think it would very much be worthwhile to consider challenging it.

This isn't directly relevant, Gary, but was the citing FCC officer the same one who is rumoured to have cited his wife for failing to identify, and was responsible for the infamous "900 number packet message" debacle? I ask because it's about the right part of the country....

The key to enjoying a movie, or play, or book, or even (gasp) television show is "the willing suspension of disbelief".

If you can't suspend your disbelief and enjoy the film, et al, then in some measure, the author/producer/writer/directory/cinematographer has failed. And so have you.

There is a time and a place for belief, and a time and a place for rationalism. Few of us are wholly rational at all times - for example, religious scientists, mothers who believe their children to be the most beautiful/brilliant in the world, etc.

The sign of a real techno-nurd is one who lets these minor inconsistencies BOTHER him. It's not important. Relax and enjoy the show.

Does it really matter that the control buttons in Dark Star were really backlit ice-cube trays with JuJuBees glued on them?

Well, in this case, the rig was an Icom IC-402. You get SSB and CW. Tuning is a VXO (and pretty darn touchy on the 402 at that). Also on the hill we had an IC-202 (the 202 is 2 meters, the 402 is 432 MHz). These are old radios but work quite nicely. We do have Icom all-mode bases for these bands, but the little rigs are quick and easy to throw in the car, and are nice QRP gear.

Faith was trying to work this guy on 10 watts (the IC-402 has a matching brick to take it from 3 watts to 10) and using a vertical on the truck which normally is hooked to the FT-5200 FM mobile. We did this all at the spur of the moment (go to the hilltop) so we improvised.

One additional note, the FN22 station had originally called me right after I had worked someone else on 432. They worked me with no problem before Faith took the mic and tried the contact. My voice seems to do better on VHF/UHF than hers.

I'm starting to dream up interesting ways to construct a full station for VHF contest Rover operation... I think that's the best way to contest this stuff that I've seen...

|> and answers, the questions in Gordon's material will still help you
|> guage your study progress.
|>

I'll vouch for this theory. I went in on Monday night, 6/14, to take elements 2 and 3A, before the question pool change. What I found was that the local VEC organization was already using the new question pools. The tests I was given indicated "Revised 7/93" on the front page.

I also have Gordon West's No_Code study guide. I noticed that a few questions appeared to be worded differently, and a found a couple that seemed totaly new. The net result was that I passed both elements (1 wrong on 2, 3 on 3A) without major problems.

If you understand the material, you'll likely have little difficulty. If your memorizing questions and answers, take the tests soon.

Now the wait begins.......

Going for the code test would be a fun thing to do, and I plan on doing it someday, but you are NOT limited to line-of-sight on VHF. You can bounce signals off the moon, work stations via satelitte and there's propogation via tropo. A little more challenging, but could be as fun.

There is an ongoing muddle arising from the fact that transmission of
music (as audio) is forbidden, but transmission of video programs with
incidental music is permitted.

If ultimate intent is to prohibit "broadcasting of entertainment to
the general public" then the FCC needs to address the fact that some
of these video programs are no less "entertaining" than music would
be.

I would prefer seeing them drop the ban on music in bands where
fast-scan ATV is permitted (and where there is little need to conserve
spectrum).

> TOLL CALL..

If you're on the east coast, it might be a bit cheaper to call the Naval Observatory in Washington, DC, for the time. That number is 202-653-1800.

If you have two telephones lines in the same room, you might even want to call them both and see if you can detect any time delay differences with a phone at each ear. Of course, the results could depend on whether your brain is perfectly centered. (Also make sure you have equal length handset cords on the two phones!) Oops. Forgot. They're in different time zones, so it won't work. Forget everything I said.

If you didn't personally observe and verify this experiment, then it's an urban legend. I'd hide behind the "system" login too if I were going to post something like this! :-) Six watts for 3 minutes simply won't cook fish.

Now free with each new yuppie-phone: the new patented Fish-disH (TM)! With the new Fish-disH (TM) on your yuppie-phone, you can cook dinner with all those wasted Megahertz that would otherwise be completely lost! Just imagine the feeling you'll have as your Fish-disH (TM) converts all that wasted energy into tasty cooked fish! Be part of the solution -- conserve endangered Megahertz with the new patented Fish-disH (TM). Fish sold separately.

This is for any scanner buffs, hams, SWLs, and CB radio hobbyiests who might have monitored some activity regarding an aircraft crash on Long Island
the following dates: Sept 28, 1989 and November 24, 1992. This is part of an ongoing interest by Unsolved Mysteries and some other investigative bodies. Here are some details which may help you when you go look through your logs.

The first crash was on the night of Sept. 28, 1989 and cleanup operations lasted from approx. 8:45pm to 11:30pm. The aircraft went down in the area of Smith's Point Beach (near Moriches Bay).
Frequencies with activity regarding this crash would have been:

FAA - Air Traffic Control Frequencies
Military - National Guard, US Coast Guard, Navy, possibly other branches
Police - Suffolk County Police

The second crash was on the night of November 24, 1992 and the aircraft went down in SouthHaven Park. Frequencies of interest in this case would have been:
FAA - Air Traffic Control Frequencies
Military - National Guard, Army, possibly other branches
Police - New York State Police
Fire - Fire Departments on Long Island
Private - Brookhaven National Lab Security
Government - Brookhaven National Lab

If you have any information regarding either of these events please send mail as soon as possible to: raver909@telerama.pgh.pa.us
Names will be kept anonymous if the person desires this.
If you are a member of a scanner, SWL, or Amateur radio group in the Long Island area please bring a copy of this message to the next meeting and let me know the results.

Thank You,
Joe

Source record: 280458

I recently bought a Ten-Tec Argonaut II and have been well satisfied with it. The price is a bit more than for the IC-728, IC-729, FT-745, etc. Of course the Argonaut II is a QRP rig, but for just a little more, there is the Delta II. These rigs had some problems when they first came out, but it looks like the problems have been fixed and (in the case of the Argonaut II) such Delta II features as computer interface circutry (you still need the $45 level converter) and a speaker jack have been added.

More data:
Antenna I used was not roof-top, but only 5' away, although this is
farther than the rubber duck.
While the clock harmonic is a nice theory, it has some problems.
At the very least, it is not the whole story. The reason is:
I used a scanner to monitor the signal coming from the keypad, and when
the htx-202 is tuned to 146.76, the signal is at 146.76, but if you change
the freq that the 202 is tuned to, the freq at the keypad changes too, ie
if tune to 145.33, that is what comes out the keypad. In fact on my 202, the
145.33 signal is much stronger than that seen at 146.76 even though no
birdie is seen at 145.33. Ie whatever freq the 202 is tuned to, that freq
comes out of the keypad area, but the birdie only shows up at 146.76, so
while it is possible that the keypad signal is triggering the oscillation,
it is quite clear that the freq of the keypad signal is not responsible for
the birdie being at 146.76. This must be some freq dependent feature of
the receive circuitry. This could very well be related to the clock
crystal, but is not due to the clock signal coming out the keypad. When I
get home I'll try putting my J-pole right next to the keypad to see if the
keypad signal is related at all.

Subject: FCC License Data Source
Newsgroups: alt.radio.scanner
Distribution: usa

I have located a relatively inexpensive source of FCC license data. There is a company called CET that sells records of all stations inside a 30-mile radius for $61. (Major cities cost extra.) The data is provided on floppy disks and is available in ASCII columnar and comma-delimited formats.

I recently sent for this data and found it impressive. The 30-mile radius around Portland, OR (which CET does not consider a major city) contains almost 10,000 records.

The data is more detailed than Grove's and cheaper for me, since I live near a state line. However, data cannot be provided for licenses that do not contain specific geographic coordinates (i.e., mobile-only systems).

To do the search, CET requires the latitude and longitude for the center of the 30-mile radius. I calculated mine from a USGS topographic map I obtained at a local nautical supply store.

The phone number for CET is 800-445-0297 (voice). To order, have your geographic coordinates and credit card number ready. I am not affiliated with CET except as a customer.

CET data covers the following services (amateur radio is NOT covered):

> I believe that the order of freq., call, loc. is not fixed. You can do it
> in any order, as long as you include all three

Frequency is unimporatant. It's call letters and city of license, which
much be given together.

> The town has to be where the transmitter is. (Or control studio,
> don't remember which.) In case this is a small town, you'll hear

Actually, it is neither. The location given must be the place the station
is licensed to, primarily the area being served by the station.

Re: Necessity of parallel resistors/capacitors in a high-voltage rectifier string. I claim that the resistors and diodes are not necessary or desirable.

Perry Scott (perry@fc.hp.com) wrote:

: Maybe someone can explain the rationale for the swamping resistors and
: transient capacitors to me. The explanation given in the ARRL Handbook
: doesn't go into detail - it just says you have to have them. Maybe we
: have better technology now than at the time the article was written.

RATIONALE FOR THE RESISTORS:

The rationale for the resistors is to equalize the voltage drop across the diodes during the portion of the AC cycle that the diodes are reverse-biased. However, the resistors are NOT necessary, even if the diode leakage currents are not matched.

When reverse-biased a rectifier diode acts like a zener: As you increase the reverse voltage, the currrent is low ("leakage" current) until the voltage exceeds the zener breakdown when the current rapidly approaches infinity (zzzzzzzaaaaapppp!). However, here is the key: In a series diode string, THE CURRENTS THROUGH ALL THE DIODES ARE EQUAL. Yes, the lowest-leakage diode will drop all of the reverse voltage until its zener limit is reached. But at that point, the current will be limited by the next lowest-leakage diode in the string. So long as you don't exceed the sum of all the breakdown voltages, no destructive breakdown occurs.

Result: Equalizing resistors REDUCE the breakdown voltage of the string! Assuming equal-value resistors, total breakdown voltage = number of diodes times the LOWEST voltage diode in the string. Without the resistors, total breakdown voltage = the sum of all the breakdown voltages.

RATIONALE FOR THE CAPACITORS:

The rationale for the capacitors is to compensate for the varying charge storage in the diodes. In effect, charge storage causes the diodes to "turn off" slowly so that reverse current flows for a few microseconds after voltage reversal. However, Perry's explanation is right on the mark:

: I observe that the on-to-off transition occurs at the top of the sine
: wave, where dv/dt is close to zero. The turnoff time for a 1N4007 is
: typically 30 uS. Now, the voltage at 30 uS beyond turnoff is nowhere
: near 1 KV - more likely around 50 volts for a 2 KV supply. The fastest
: diode in the chain will hold that.

Exactly. If anything, the capacitors might make matters worse: they will tend to couple extra current into the last diode to turn off.

Another problem with both resistors and capacitors is reliability. Equipment failure rate tends to be proportional to the number of parts: 3 times the parts = 3 times the failure rate. If any one of the diodes or resistors fails, it will likely take out the whole diode string.

3657. OX/N7PQO To Operate in Greenland

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-16 22:15:26 UTC
From: arthurj@equinox.unr.edu
Message-ID: <1993Jun16.221526.9932@physics.unr.edu>
Source record: 280472

This is to follow up on my earlier posting about my colleague Mike Savage, N7PQO who is now enroute to GISP2, the Greenland Ice Sheet Project 2, at the apex of Greenland's ice sheet, some 3,150 meters high. Ice thickness there is in excess of 3,000 meters.

We heard from the Danish government who have assigned Mike the call OX/N7PQO. Our request for an exception to the rule about no third-party traffic was not approved; or at least, nothing was said about this in the letter granting the license so we must assume we cannot do phone patches for the expedition members.

Mike shipped an HF transceiver (100 watts), a Powerwave 8-band vertical, and a Cushcraft A3 beam antenna to the GISP2 camp about three weeks ago. Initial plans are to set up the vertical and see if that will do the job. If not, the beam will be erected and most likely fixed in an orientation towards western N. America. Mike did not take a rotator.

OX/N7PQO will operate daily at 0100 UTC, as time and energy permit. General QSO's worldwide will be on 14.340, in the U.S. general-class part of the 20 meter phone subband, starting around June 27 as best we can predict & plan at this point. Station operations will continue until around 1 August.

I will post updated schedules and frequencies in this forum if that becomes appropriate.

I will function as the manager for QSL's. They can be directed to me, Arthur Johnson, AA7UT, 11060 Fir Drive, Reno, NV 89506, U.S.A. An SASE, at minimum, or an SAE with IRC or equivalent would be appropriate and much appreciated.

My thanks to the many people who wrote with comments and suggestions about suitable antennas. Now we will see how it goes!

Agreed, it's hard determining what you're going to need or not. During
the winter storm we had, we brought enough equipment with us to outfit a
small army but it was well worth it as the equipment at the local Red
Cross is severely outdated, and mostly non-functional.

steve must be referring to the former WOWF ("WOW-FM") which
abandoned its pitiful attempt at hip talk radio to replace it
with a pitiful attempt at "YOUNG COUNTRY," whatever that means.
I suspect it means -all achy breaky heart, all the time." eeew.
This discussion probably should be in rec.radio.broadcasting,tho.
To address the ID question, Call and location are required, as
others have indicated. I do not believe there is any reg about
frequency for radio ID's. Once an hour as near to the top of the
hour as possible. They may be burying it but it's supposed to be
there. The location is that which is indicated on the station's
license. WOWF was earlier WDFX and WDTX and the late lamented
WABX, licensed to Detroit, with studios elsewhere. If 99.5 is
indeed not IDing, call the radio police. (I belive the CE there
is a ham). Chuck Reti Detroit,MI

When I was at WDOM, it every hour within +/- 5 minutes of the hour. This
was from 1985 to 1987.

While at WALE, we ID'd the station at each break but the true ID came up
every hour (The hourly one included callsign, frequency, and location).
For example:

You're listening to 91.3FM, WDOM in Providence.

990AM WALE Renegade Radio in Providence.

3663. ECB Layout Software?

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-16 22:57:22 UTC
From: johnr@tvnews.tv.tek.com
Message-ID: <1993Jun16.225722.453@tvnews.tv.tek.com>
Source record: 280545

I'm looking for some free or inexpensive software to do simple one or two-sided ECB layouts. I'd like something that runs on MS-DOS (or Windows) and is simple to run.

What I want to do is place parts dollies, draw the traces (preferably with a mouse) and print an actual size plot on a laser printer.

I've looked at a shareware program called DROEGE that appears to do this, but the human interface seems way too complex. What's a good FTP site to check for programs of this nature?

Tnx es 73,

Hello from Iowa!

>The reg. is once per hour. And the format is: freq, call, loc.
>There are certain variants on that. Examples of an ID are:

I believe it's might be at the top of the hour, and once every ten minutes or so. I am assuming from the towns you mention below that you're from Iowa. I'm from the Waterloo/Cedar Falls area (just south of Waterloo), and I use highway 175 to get there and back from Ames (I'm at ISU. Go 'Clones! :).

>97.7 KGCI-FM Grundy Center
>or if there are two transmitters:

>The town has to be where the transmitter is. (Or control studio,
>don't remember which.) In case this is a small town, you'll hear
>something like:
>97.7 KGCI-FM Grundy Center, Cedar Falls and Waterloo. Still the basic
>legal ID, but w/ extra towns added on so people actually recognize what
>state you're in.

I believe the station ID must include the city/town the station is primarily licensed to broadcast to. For example, all of the Ames/Des Moines TV stations share three transmitting towers (who shares which ones, I don't know for sure) just north of Ankeny, even though they are licensed primarily for Des Moines or Ames (as is the case for channel 5, WOI, my employer).

Also, entities like Iowa Public TV, which has 8 bazillion transmitters throughout the state but only one control point (the studios in Des Moines) must have an ID that includes the callsign, channel number, and location of each transmitter. IN other words, each of IPTV's stations is licensed for the locality it is meant to broadcast to, instead of being licensed for Des Moines.

IPTV also has translator stations which function essentially as broadcast TV repeaters, repeating the signal from the closest IPTV station. The IDs for these translators is given out only occasionally (namely, at sign-off).

I'm sorry I rambled. I just thought I'd say hi and elaborate a little on the subject.

One little tidbit about including extra towns in the ID: the first one *always* must be the city/town the station is licensed for.

Congratulations on even -finding- a used IC32! For the price you paid, the extra $90 would be worth spending, in my opinion. Although this model was one of the last large style radios, and rather heavy, it is also one of the best for intermod rejection.

: I'm looking for some free or inexpensive software to do simple one or
: two-sided ECB layouts. I'd like something that runs on MS-DOS (or Windows)
: and is simple to run.

: What I want to do is place parts dollies, draw the traces (preferably
: with a mouse) and print an actual size plot on a laser printer.

I've just been trying out a hot program that should do it for you.
It's called CIRCAD. You can input the schematic, then lay out the
PC board and do a netlist compare to check for accuracy. The program
also has auto-route capability: enter the schematic then place the
parts on the PCB and the program connects the traces for you.

It can output to an HPGL or DMPL pen plotter or to a PCL printer such
as a Laserjet or HP inkjet printer. It can also input/output
Orcad, Tango, Autotrax, AutoCAD and Gerber files. There is no copy
protection or "dongle" required. Cost is $995 for the commercial
version or $295 for the ham version. The two versions are the same --
except with the ham version you get no support and you are not
supposed to use it for commercial purposes.

The whole program is written in assembly language so it runs fast
even on a slow 286-class PC. I am currently running the demo version,
which limits max circuit size and does not output Gerber files.
It is very easy and intuitive to use, especially if you have ever
used any similar program before.

I got my demo directly from the source:

Holophase Inc.
6191 Orange Dr.
Suite 6173-L
Davie, FL 33314
800-528-6516

The ham version is available from Jay WB0VNE at 612-492-3819.
I haven't called him yet -- he may have the demo version available
as well.

The program author, Fred Lehman, is an old-time assembly language
programmer from the early IBM days. He called me a couple times
to see how I liked the program -- loves to talk. Sounds like a
real "programmer's programmer."

I haven't used the program extensively yet, but it seems like a very slick program.

```

>
Still more data, partial retraction or now I'm really confused?
Tried the above experiment with 2 other radios, and got the opposite
result?!, ie freq of keypad signal remained constant as htx202 freq changed.
Also tried experiment with 202 within 2 inches of J-POLE, and birdie
was barely noticable. Am wondering it above result where freq seemed to
change was do to interactions of the IF's / LO's of the 202 and scanner,
whereas the 2 receivers I tried later may have had different IF's?
Anyway, I'm still confused. It does sound like a microprocessor birdie
though.

>characters, or does anyone want all 6?
>73, Fred, K4DII
>(EL98np)
>fred-mckenzie@ksc.nasa.gov

The best frequencies to monitor for the US are:

50.125 MHz domestic calling frequency
50.110 MHz intercontinental calling frequency
28.885 MHz international liaison frequency/net.

Use 28.885 MHz to set schedules with DX and/or to find out exactly what frequency the DX station is using within the DX window between 50.125 to 50.100.

Other frequencies to listen include:

50.080 to 50.000 for beacons indicating areas that are open
35 to 50 MHz for foreign tv broadcast, commercial and police operations. Precursors to 50 MHz openings
50.080 to 50.100 for cw stations both domestic and dx

My best catch was J52US, found by just wandering around the 50.080 to 50.100 cw portion.

Monitoring 6m can be very boring if listening only to one freq. I usually set up my IC551D to scan between 50.150 and 50.080 with the squelch off. Any signal on the band will present itself as a rising/falling pitched tone as the rcvr tunes through it. This tone is stands out from the normal boring rushing waterfall.....

Grid squares - Most US are interested in the 4 alphanumeric indicators.
Some europeans are interested in all 6.
Most of the DX I have worked only sent RST reports
(although 4x grid format is also not unusual).

> or experience with this rig?
>

I saw this rig (protptype?) at Dayton. It looks pretty good. I called
TEN-TEC this morning and they said that it would be available hopefully
bu the end of July. The following is the text of their "slick" ad.

TEN-TEC SCOUT Model 555

Back to Basics - With Real Performance

SIMPLE: SSB or CW, just sit down and operate! Master every feature
in a few minutes - no modern rig is as easy to use. Simply plug in
the desired band module and work any band 160-10 meters including
WARC.

SMALL: At half the size of other "small" transceivers, SCOUT makes
mobile and portable operation a cinch. This travel companion even
fits in a briefcase. Try that with other HF rigs!

SELECTIVE: Revolutionary, patented "Jones" filter. A variable
bandwith 8 pole crystal filter from 500 Hz to 2.5 KHz. The right
filter for every band condition at the turn of a knob. No need to
buy expensive accessory filters.

POWERFUL: 50 watts output is enough power to work the world, even
for a new ham. And power to spare for the skilled amateur. Runs
directly off 12 volts, even the cigarette lighter in your car for
easy installation.

SMART: TEN-TEC's exclusive "FLS" frequency lock system keeps VFO
virtually drift free regardless of temperature variations. THE
"RISC" microprocessor running at 5 MIPS also manages the large
digital display and built-in iambic keyer.

LOW PRICE: At $495, its closest competition is nearly twice the price. No other rig offers so much performance at so low a price.

SCOUT is "back to basics" and redefines value for the active amateur yearning for a second rig or the new ham searching for an affordable way to experience the world of HF communications.

FACTORY DIRECT $495.00

Additional Band Modules: $25.00 each

SCOUT ACCESSORIES:

Model 801, 160 meter plug-in band module

Model 802, 80 meter plug-in band module

Model 803, 40 meter plug-in band module

Model 804, 30 meter plug-in band module

Model 805, 20 meter plug-in band module

Model 806, 17 meter plug-in band module

Model 807, 15 meter plug-in band module

Model 808, 12 meter plug-in band module

Model 809, 10 meter plug-in band module (28.00-29.0 MHz)

Model 937, Power Supply - Matches SCOUT, 115 VAC, 60 Hz input. 13.8 VDC, 11 amp output @ 50% duty, 7 amp continuous. DC output binding posts, Fold-back current limiting, over voltage protection.

Model 297, Noise Blanker, effective on ignition and some impulse type line noise, field installable.

Model 296, Mobile bracket mounts on top or bottom of transceiver in 4 positions.

Model 607, Weighted key paddle, single paddle style with adjustable spacing.

Model 700C, Handheld mike, electret with coiled cord and 4 pin connector.

Model 291, 200 watt antenna tuner, "T" match circuit matches variety of unpalanced antenna systems.

GENERAL SPECIFICATIONS:

MODES: CW, LSB, USB (Normal sideband for the band in use)

FREQUENCY RANGE: All ham bands 160 through 10 meters available through plug in modules. Overshoot at upper and lower edges.

DISPLAY: 4 digit to 100 hz resolution, .56" LED

FREQUENCY CONTROL: Permeability tuned oscillator (PTO) mixed with a crystal oscillator for each band.

OFFSET TUNING: +/_ 1 KHz nominal - receive

FREQUENCY ACCURACY: +/- 100 HZ @ 25 deg. C

ANTENNA: 50 ohms unbalanced. POWER REQUIRED: @12-14 VDC; 600 mA receive, 10 A transmit @ 50 watts out, 4.5 A @ 5 wats out.

CONSTRUCTION: G10 epoxy glass boards, most field replaceable. Molded plastic front panel, aluminum chasis, steel top and bottom.

DIMENSIONS: HWD 2.5" x 7.25" x 9.75" - 6.4 x 18.4 x 24.8 cm

WEIGHT: 5lbs, 3 oz - 2.4 kg

TRANSMITTER:

RF OUTPUT: 50 watts, ALC controlled internal adjustment to reduce power.

DC INPUT: 125 watts maximum @ vt 0% ducle r te.

Message-ID: <C8r2Hq.4C1@fmsystm.ncoast.org>
Source record: 280538
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.policy

I need a Field Day question answered ASAP,

section 8, part A, subpart 9, says:
VHF/UHF: 100 points can be earned by completing at least 10 QSO's (excluding packet contacts) on any band or combination of bands above 50 Mhz (VHF/UHF bands) during the Field Day period. A VHF/UHF station _(one)_ does not count as an additional transmitter. This station is not limited to making just 10 QSO's. It may be opperated for the entire field day period and all contacts (excluding packet contacts) count for QSO points credit, including the first 10.

My club needs some clarification on this rule from the ARRL.

Please e-mail me a better explanation of this rule.

No, it was the Field Engineer who cited the DeKalb police for transmitting
false and misleading signals by mounting an old radar unit on a road sign
to fool motorists into thinking there was a speed trap ahead.

The rules used to require the ID to be as close to the top of the hour as possible, but that's been deleted in the latest rules. Instead it just says "once an hour at a natural break in the program".

The content has to be the callsign immediately followed by the city of license. Frequency data is not required. Another oddity, "TV" is part of the legal callsign of a broadcast TV station. They have to say "WXIA-TV Atlanta" not just "WXIA Atlanta" to be legal. No station slogan is allowed between the callsign and city of license, though it may proceed or follow them.

I'd be tempted to follow that advice if it weren't for the number
of picayune citations our stations have received over the years.
Our communications lawyers tell us to stick to the written regulations
and not some nebulous intent as interpreted by a staffer. They say
that if it's not published in the Federal Register, or formally
issued in writing to the station in question, we should ignore
such interpretations.

Artistic license is one thing, but certain gross errors aren't your failure. For example, jet contrails or power lines across an old western sky, or to pick on my favorite bad movie, when a soldier in _Ice Station Zebra_ knocks over a styrofoam iceberg. The classic squealing tires on gravel is an example of artistic license. It cracks me up, but it's intended to add to the dramatic tension of the car chase.

It's unfortunate fact that much of the public gets their education about unfamiliar subjects from TV and movies. When the movies get it wrong, it can have a bad effect. So hams get upset when ham equipment is portrayed as doing impossible things, and gun owners get upset when firearms are portrayed incorrectly. If the movie is parody, or set in a science fiction or fantasy venue, then such gaffes are often acceptable. But when the movie presents a claim to realism, it's not acceptable for them to do ten impossible things before breakfast. It's the job of the continuity people and the technical advisor to keep things straight.

Being in the business is a curse in some ways. I notice all the inconsistencies, the bad double shadow lighting in an "outdoor" scene, the boom mike in the shot, etc. I even watch the cue marks for reel change. If the movie's story still grips me, the crew has done a superb job.

I'd prefer the FCC to get out of the content regulation business altogether. But that's not going to happen because of the political situation. The urge to control and social engineer is too strong. With the rise in popularity of talk radio, who's to say normal amateur radio activities aren't entertaining the public. There's certainly enough interest in scanners. Perhaps we need regulations to make amateur talk less interesting. Naw! that's already the case too often. :-)

Shame on you Fred. :-)

In a voice bandwidth, the S/N for Morse is no better than for voice.
With an operator on the other end with throughly programmed wetware,
he might DSP it out of the noise, but the typical operator is just
going to wonder who's tuning up on the DX frequency. :-)

>limit is reached. But at that point, the current will be limited by the
>next lowest-leakage diode in the string. So long as you don't exceed
>the sum of all the breakdown voltages, no destructive breakdown occurs.

This is a novel approach to the problem. However, I think the reason
commercial designers don't do this is that most rectifier diodes aren't
built to operate as zeners and some junction damage occurs when the
reverse voltage threshold is exceeded. The damage is often cumulative,
and ultimately results in a failed diode.

>Another problem with both resistors and capacitors is reliability.
>Equipment failure rate tends to be proportional to the number of parts:
>3 times the parts = 3 times the failure rate. If any one of the diodes
>or resistors fails, it will likely take out the whole diode string.

A third problem is cost, each extra part adds cost to a mass produced
item. Most good production engineers are trained to eliminate any
unnecessary parts, yet they all seem to include the networks across
diode strings. Are they just following conventional wisdom, or perhaps
do they know something you've overlooked?

>in any order, as long as you include all three
>

You're both wrong. The rules say you must say the call sign immediately followed by the city of license as close to the top of each hour as program permits. You can say anything before or after, as long as you say the call and city of license together. I'm not exactly sure of the rule, but I think the ID must be in english, too.

Now, some stations (like the one I work for) try to "hide" their legal ID in a cutesy slogan... For example, the station I work for says:

"You're listening to KODA, Houston's Sunny 99.1"

Thus meeting the letter of the law, by saying KODA, Houston. I know it's stupid, but I just engineer the stuff, I'm not responsible for program content! :)

What is the use of this extra breakdown voltage ? When you design a
rectifier stack, you have to assume that the breakdown voltage for
each diode is the one specified by the manufacturer (1 kV for 1N4007).

Is it good engineering practice to operate high voltage rectifiers
in zener breakdown mode ?

I once replaced the rectifying tubes (double diodes) in two different
amplifiers with silicon rectifiers when the orignal tube types were no
longer available. As the high voltage was only about 450 VDC, the
required PIV for each rectifier is about 1200 V, so two 1N4007 in series
should do the job. As this was only 600 V/diode, no resistors or
capacitors where used.

Everything worked OK for a few weeks, but then one diode was blown
in one amplifier and a week later the same fault occured in the
other amplifier. After replacing the faulty diodes and after adding
the capacitors and resistors, the amplifiers have worked since then
for more than a decade.

When I later analyzed the situation, I concluded that the reason
for rectifier breakdown might have been some very short reverse
peaks caused by switching inductive loads in the vicinity. If the
off-state voltage in the diodes are unequal, so is their off-state
capacitance and the very short peak voltage was not evenly
distributet across the diodes.

When the resistors and capacitors were added, a high peak voltage
comming from the primary side of the transformer is damped by the
capacitors (and the resistance in the secondary winding of the
transformer) and the remaining peak voltage is evenly distributed
across the diodes by the capacitors.

It is hard to tell which effect is the most important (damping or
evenly distribution) as the size and duration of the peaks are not
known.

Maybe they make better diodes today, but the 1N4007s of 1970's vintage
are not very robust.

> mobile, on the Extra Class frequencies.
>
> 73, Fred, K4DII

The ARRL 75m extra-class WAS award is for contacts with extra-class formatted calls on the extra-class portion of the 75m band. That means 1x2, 2x1, or 2x2 "A" calls. Neither your call nor my call will qualify, nor will 2x2 "K" calls, although we can certainly EARN the award. After you get the ARRL award, with its serial no., the GERATOL (Greetings Extra-class Radio Amateurs - Tired of Operating Lately?) NET will give you its certificate. I think the Geratol Certificate is one of the prettiest ones around. And the GERATOLers are some of the friendliest and most helpful netters around - I went to their gathering at Dayton and thoroughly enjoyed meeting them. The ARRL WAS certificate no. becomes your Geratol Number. The Geratol Net then has a bunch of endorsements (over 20 different ones), which seem to be for the wallpaper collector who has everything else: WAS 1x2, WAS 2x1, WAS 1x3 "W", WAS 2x3, WAS w/ YLs, WAS with callsigns which are also the initials of the operator, etc. etc. etc. Its kind of fun. The Net meets every night around 3768 kHz at 0100Z October through April, but they continue to get together informally during the summer months, same time and frequency. I usually work 20m CW for awhile every evening and then wander over to the net to say howdy. But I'm not likely to pick up my remaining 3 states (FL, ID, & AK) during the summer unless I can find a sked.

I have another FD question.......

Can a 1B (battery) station claim the bonus points for 100% emergency power?
Seem like he should but it seems a bit redundant.

I know 100% emergency power means *everything* is running independent
of the mains from radios, lights, accessories, even the coffee pot :-)

3698. 6m countries in europe

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-17 13:33:28 UTC
From: dejongh@dutiws.twi.tudelft.nl
Message-ID: <C8rpns.F2L@dutiws.twi.tudelft.nl>
Source record: 280567

To whom it may concern:

Lately a few new countries were active on 6 in Europe:

Besides the OK and OM stations (as of jan 1st 1993) there's activity from:

Andorra: C31HK, Bosnia: T97M and T91ERF, SV5: SV5TS, UC2: UC2AA, UC2AAA, EV9A, EV8A, Jan Mayen: JX3EX

I haven't worked all but with only 5 countries to go I'm sure I'll finish my DXCC before the end of the Es season.

Remco (PA3FYM@JO22 , besten@chem.ruu.nl)

only 5 to go..... yippie!!

3699. First Rpt of 93 144Mc E-SKIp Opening/ June 9th

TAR files are not compressed - they are simply archive files. Kind of like doing a backup to tape, except instead of tape the data goes into a file...

You will need an untar utility. If you have FTP access, look at wuarchive.wustl.edu under /archives/mirrors/msdos...

3702. SPICE Model for Multi-Layer PCB Traces

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-17 14:50:16 UTC
From: c2xjcb@kocrsv01.delcoelect.com
Message-ID: <1993Jun17.145016.13762@kocrsv01.delcoelect.com>
Source record: 280329

I am looking for information regarding how to model a Printed Circuit Board (PCB) signal trace on a multi-layer PCB with power/ground planes. Common literature provides Zo and td equations for stripline (trace surrounded by two ground layers above/below) and micro-stripline (trace floating above single ground-plane), but not for the case where the trace is either 1) sandwiched between power AND ground planes or 2) above/below a power/ground-plane pair.

Specifically, I am interested in the following topologies:

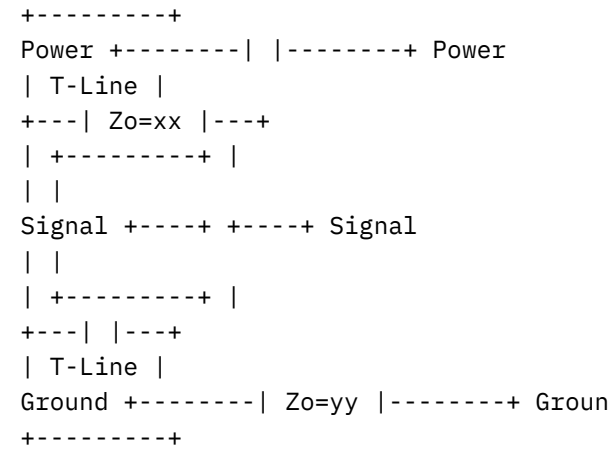
Layer 1 Power Plane or Signal layer

2 Signal layer Ground Plane

3 Ground Plane Power Plane

4

My current strategy is to treat the signal-to-ground as a micro-stripline with the Zo determined by their geometries (i.e. trace width, plane-to-plane spacing, etc.) and the signal-to-power as another micro-stripline; the Spice model would then be a subcircuit consisting of two "Transmission Lines" (4-port devices) connected with the "signal" going to/coming from both T-lines, power going to 1 T-line, and ground going to the other T-line, such as:



Also, does anyone have a good idea about modeling the Zo discontinuity of via-holes, particularly, as the signal trace passes from 1 layer (say the top side of the PCB) to another (say the bottom) thru the power/ground planes (say in the middle)?

Any words of wisdom would be greatly appreciated.

Gene writes:

5 years later, I started a 2 year electronics program at the
community college. I could have skipped much of the first quarter entirely.
A good deal of the second quarter was familiar.

I learned about electronics on my own without an elmer, without
community college (later got the 4 year electronics degree) and
didn't find the general test to be difficult at all when I was
a kid.

I might just depend on how much one is really interested in what
is going on inside the box and how much one wants to apply him or
herself.

A lot of people just don't care.

But you are right in that the technical level is way down,
and perhaps this is due in part to the fact that one cant
really do much when the box breaks these days, what with
cpu's, surface mount, etc etc... It used to be that when
I had a problem with my box, I could open it up, and find out
which resistor or capacitor etc... was bad. Doing this
was more valuable than any book or college class. I had to
be able to use a VOM (remember those?), scope, solder and
figure out how the circuit works... These days, one just
packs the xcvr in a box and ships it off to get fixed.

3705. callsign server update

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-17 15:48:33 UTC
From: bowen@cs.buffalo.edu
Message-ID: <C8rvwy.7M6@acsu.buffalo.edu>
Source record: 280571

The data from the first QRZ! CDROM has now been merged into the server so the US information is as current as possible. Note that the FCC is no longer providing station address information in the data so the server doesn't print those lines anymore. There is also no "last processed" date because it's always the same as the "valid from" date. Everything else is pretty much the same, though. Thanks to Fred Lloyd, AA7BQ, for this data.

I also update the Canadian database. A new and more complete one was given to me by Barry McLarnon, VE3JF. I have actually had it for a few months but it wasn't in the format I was used to so it took me a while to convert it. That should be of more use, though.

The US club calls (originally donated by Jere Sandidge, K4FUM) have been reprocessed by Bob Wier, WB5KXH, so that the information is a little more useful and easier to search.

Thanks to everyone involved.

Now... as far as the "when will the server be updated" questions... the new answer is "whenever you buy me a more recent QRZ! CDROM". Now that I have the software to convert and install that format it will only take a day to install the new data after getting a copy of the disc. But I have no intention of purchasing these discs myself. If the net wants the data to be up to date, then people will have to put up the funds to get new data to me. Discs can be purchased for a minor cost ($25 I think) from

Walnut Creek CDROM
1547 Palos Verdes Mall #260
Walnut Creek, California 94596

Please contact me before sending a disc, though, so I don't have people sending me multiple copies of the data.

I guess that's it. Enjoy...

Devon

3706. Re: protection from lightning, help please!

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-17 15:51:56 UTC

Message-ID: <121020020@hpldsla.sid.hp.com>
Source record: 280271

Hi Eric,
My first suggestion is - DON'T DO IT !!! ......and sleep well.....
However if you still like SWL you can DO NUMBER of things....
If you dont like outdoor ANT there are super indoor ones some of them
better than any LW. Many of us used ANT in attic for many years before
going up.
As to your question:
Rule NO. is " Any antenna should be grounded at ALL times when operator
is not present.
Rule NO. 2 is " DO NOT operate if atmosferic condition warrent coution"
Rule NO.3 ALL Anttenna shuld incorporate a) Lightning grounds b)Lightning
Arrester.
You will find more info in ARRL Antenna Book,
The ARRL Handbook, The NationalFire Protection Asso. Code - NFPA no. 78-1983
Good Luck

3707. TH-78 - How receive 800 MHz on both sides?

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-17 15:59:54 UTC
From: gjernes@mpr.ca
Message-ID: <1993Jun17.155954.11508@mprgate.mpr.ca>
Source record: 280479

When I try to receive 800 MHz on both sides of the radio, I can only get the 800 on one side and 400 on the other.

Similarily, when I try to receive two 300 MHz signals, I can only get 300 on one side and 140 on the other.

Needless to say, the mods have been done on this radio.

I can receive two 140 MHz signals and two 400 MHz signals fine.

I hope you can tell me if this feature is not implemented, or how I can make it work!

Thanks,

Murray

>

That's when a TV station has a 6-letter callsign, same as 6-letter FM
callsigns. Examples: WCBS-TV, WCBS-FM.

However, when a TV or FM station has a simple 3 or 4-letter callsign the
ID is just the callsign -- No "TV" or "FM" added.

Gary KE4ZV says

>You should use end fed antennas for balloons.

I agree, Gary, but I have a story to tell about that! A few years back, the club I'm in did just that for Field Day: we sent up a weather balloon with a *long* wire (several hundred feet), to be connected to a Johnson Matchbox, then to the HF rig. Well, the first time someone grabbed the wire and touched ground, a tingling was noticed. (The wire wasn't yet connected to the Matchbox or the rig.) We tied off the tether/wire (but not to ground) while we did other Field Day things. Later a few of us went back and I proceeded to solder a lug to the wire to connect it to the Matchbox. POW! I got a good charge off the wire! I felt thoroughly embarassed and since someone was running a camcorder, I now get to relive the embarassment every year when we show Field Day videos to get people psyched...

We ended up doing what is done with many AM broadcast antennas: connecting an RF choke between the antenna and ground, then tapping off the wire above the choke. What the RF choke does is act as a short circuit to ground for DC (to drain off the "static charge"), but serves as an open circuit to RF to keep the RF from being sent to ground. I was happier, the HF rig was certainly happier, and the antenna worked great!

Nope, just once per hour, but most stations like to keep the listener
knowing what station they're on by saying the callletters more often.
Easier for the listener to find a station.

>I'm from the Waterloo/Cedar Falls area (just south of Waterloo),
>and I use highway
>175 to get there and back from Ames (I'm at ISU. Go 'Clones! :).

Go ISU!

175...good road: small, out in the boonies, and actually goes somewhere.

>>97.7 KGCI-FM Grundy Center
>>1190 KDAO Marshalltown and 99.5 KDAO-FM, Eldora.
>>K39AS Marshalltown

Had to get a word in here for former employers...

>I believe the station ID must include the city/town the station is primarily
>licensed to broadcast to. For example, all of the Ames/Des Moines TV
>stations share three transmitting towers (who shares which ones, I don't know
>for sure) just north of Ankeny, even though they are licensed primarily for
>Des Moines or Ames (as is the case for channel 5, WOI, my employer).

Oh, those towers are for transmitting? I thought they were for
travellers trying to find their way around. Like a big landmark!
j/k

>Also, entities like Iowa Public TV, which has 8 bazillion transmitters
>throughout the state but only one control point (the studios in Des Moines)
>must have an ID that includes the callsign, channel number, and location
>of each transmitter.

Just like TV39 in Mtown which carries Channel America. The ID is
something like 9 or 10 CG pages of calls and locs.

>One little tidbit about including extra towns in the ID: the first one
>*always* must be the city/town the station is licensed for.

Which makes some ID's kind of humorous. You'll hear a station licensed
for some (where's that?? never heard of it...) little town. The ID

will go something like:

CALL, little town said really fast and quietly, BIG TOWN, and BIG TOWN,
both said loud and slowly (echo maybe? No, now we're getting into
Stupid DJ Tricks.).
I think that there is a station in Des Moines that does something like
that because they're just outside of DM or something in one of those
Population: 3 towns.

Speaking of funny things at stations...
When I used to work at KDAO, there were 2 Mikes, 2 Tims, a Chuck,
and a Charlie. When I first started there, there were even two
Joels!
There was the Mike and Tim show in the morning on weekdays (both
were full-timers) and then there was the 'Mike and Tim' show
in the afternoon on Sundays with the two part-timers. What was
funny about the Joels was that they worked the same shifts, just
different nights!
Chuck and Charlie both worked on Sunday in consecutive shifts.

Anybody else have stations like that?

>all mode 6m capability. The Kenwood has a few more bells and whistles
>and gives you 50W on 6m (rather than 10W with the 729). I use a 10-in/
>100-out linear with the ICOM. The rig has performed flawlessly for me!

Welcome to 6m, Jim! When I get things put back together after the big
contest last weekend, I'll be looking for you. I'm in FN42 so it should
be pretty easy to work you. I may have worked you last weekend from W1TKZ
on Mt Equinox in FN33...

I'm very glad that Icom makes the 729, because I'm hoping that its 6m
capability for only $250 extra will encourage more 6m activity. But, my
advice is that if you've got the money, get the Icom 575A or 575H instead.
I've read one comment on the net that the 729's receiver on 6m isn't that
good and that would be my suspicion too. The 575A is 10 watts, and the 575H
is 100 watts. (AES is running a special on the A in their latest catalog.)
The 575 is a separate 6m all mode rig with a truly excellent receiver. W1TKZ
has used a Kenwood TS600 on Mt. Equinox for several years and all kinds of
stuff got into the receiver. We used an Icom 575H this year and nothing,
and I mean nothing, outside of the 6m band got into that receiver! This
is the first time I've seen a 575 put through the paces in a demanding
environment and it worked great. We worked incredibly weak stations,
could hear stations 10 kHz away from W2SZ/1 for a change :-), and nothing
got through the front end even with the built-in preamp on.

Also, for people thinking about 6m, don't forget used equipment like a Yaesu
FT620B or Kenwood TS600. I've seen them for around $200 at flea markets.
They're great 6m rigs for getting started and always good to pass down to
another newcomer if you get serious later...

Just my opinion, and I don't have anything to do with Icom or dealers...

Why are you sending this to rec.radio.amateur.policy if the ARRL is the organization you want?

Try mailing your specific question(s) to Billy Lunt, "blunt@arrl.org".

Good Luck!
>
>Please e-mail me a better explanation of this rule.

Or you could call Billy Lunt on the telephone?

Have fun at Field Day!

Amen to Gary. If we let undesirable laws site around on the books
because they aren't being enforced consistently, that is a bomb waiting
to go off. Just because you are being allowed to do something
technically illegal doesn't mean that later another official would
decide to enforce that law strictly. Why else do we write laws down?

Bruce,

While it might not be the proper thing to do, and it might have
bruised your opinion of the ham radio world, the fact remains that you
were not hurt by what you heard. You now know that you can expect such
if you tune to certain parts of certain bands at certain times of day
and if it truly bothers you, you won't do it again. The matter of free
speech is more important, overall, than your right to be able to put
your radio on any frequency you choose and not be offended. Remember
too, that what is offensive to your ears may not be to the next guy.
Good clean language may be just as offensive to some as their foul
language is to you. Yes, I remember the early days when I first
slipped and said "damn" on the radio. I sweated that one out for the

next two months, waiting for the "pink" mail to come rolling in. It just wasn't done then. Times have changed and so have the standards that we live by on a daily basis. I'm with Gary C on this one.

73, Gary

I notice in (U.S.) Broadcast IDs (am-fm) the stations now state a bunch of
major cities in their coverage area and not just the city they are in.
I assume they are staking out their market for some legal related reason.

Anyone know why this is being done?

3728. TS-430 problem T/R relay?

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-17 19:02:20 UTC
From: RONALD.REDER@OFFICE.WANG.COM
Message-ID: <199306171812.AA00655@tuna.wang.com>
Source record: 280504

I never saw the original posting on this, but it sounds similar to a problem I had with my TS430s and which I FIXED :-)

My symptoms were that the power would drop to zero for no reason, but would usually come back if I hit the case of the radio, especially near the back, left side. I tried may times to find this, but the problem went away when I opened the case and turned the radio on its side. Then it would happen again in a few days.

I finally found out the problem was a bad connection in the co-axial cable between the driver and the final amplifier. This cable is grey in color and about 3mm in diameter. The end has a connector plug that plugs into a socket on the RF printed circuit board (inside the bottom rear of the radio, I believe). Turn off the power. Remove the top and bottom covers from the radio. Locate the driver cable and use a small pliers to gently remove the cable plug from the socket on the circuit board. Examine the center pin of the plug.

On my radio the center pin was crimped to the small diameter, solid wire that formed the center conductor of the co-axial cable. The crimp was a little loose so the wire could move in the center pin. This caused the problem with my radio. I carefully soldered the wire to the pin. Then I plugged the cable back in, replaced the covers, and tried the radio. Success!

There are several similar co-axial cables in the radio. If the driver cable is not the problem, I suggest you check all of the similar co-axial connectors in the radio. Perhaps one of the assembly technicians had the wrong crimp adjustment when several of the cables were prepared?

I don't know if this is related to the original poster's problem, but I decided to offer it just in case..

73, Ron KA1KCU

3729. Re: SB200 power supply problems - help please.

Source record: 280497

Kein{nen Paul (k23690@lehtori.cc.tut.fi) wrote:

: Alan Bloom (alanb@sr.hp.com) wrote:

: > Result: Equalizing resistors REDUCE the breakdown voltage of the string!

: What is the use of this extra breakdown voltage ? When you design a
: rectifier stack, you have to assume that the breakdown voltage for
: each diode is the one specified by the manufacturer (1 kV for 1N4007).

1 kV is the minimum guaranteed breakdown voltage. A typical 1N4007 will
do better than that. The higher the breakdown voltage, the more margin
your design will have.

: Is it good engineering practice to operate high voltage rectifiers
: in zener breakdown mode ?

Remember that the current will be limited to the leakage current of
the lowest-leakage diode in the rest of the string. A few micro-amps
of zener current will not hurt.

: I once replaced the rectifying tubes (double diodes) in two different
: amplifiers with silicon rectifiers when the orignal tube types were no
: longer available. As the high voltage was only about 450 VDC, the
: required PIV for each rectifier is about 1200 V, so two 1N4007 in series
: should do the job. As this was only 600 V/diode, no resistors or
: capacitors where used.

One problem with replacing tube rectifiers with silicon diodes is that
you will likely get a much higher output voltage. The solid-state
diodes only drop about a volt, while the tubes reduce the output
voltage much more than that.

: Everything worked OK for a few weeks, but then one diode was blown
: in one amplifier and a week later the same fault occured in the
: other amplifier. After replacing the faulty diodes and after adding
: the capacitors and resistors, the amplifiers have worked since then
: for more than a decade.

: When I later analyzed the situation, I concluded that the reason
: for rectifier breakdown might have been some very short reverse
: peaks caused by switching inductive loads in the vicinity. If the
: off-state voltage in the diodes are unequal, so is their off-state
: capacitance and the very short peak voltage was not evenly
: distributet across the diodes.

I'm not sure what the off-state capacitance of a 1N4007 is, but I
doubt it's more than a few 10's of pF. It would take a very fast

transient to couple much energy through such a small capacitance. I doubt that those high-frequency components would make it through the 60-Hz iron-core transformer. If they did, then the easiest solution would be an AC line filter. You should have one of those for RFI filtering anyway.

Slower line transients (in the few millisecond+ range) are indeed a problem. They are not filtered out by reasonably-sized line filters (or capacitors in parallel with the diodes) and can cause much greater than the expected reverse voltage to appear on the rectifiers. That's why you should design your HV rectifier string to have 2 or 3 times the nominally-required PIV rating.

: I think these two people are taking extreme views. I fall somewhere in
: between as probably does most every other ham. I am an atomic
: physicist, but I typically don't do atomic physics while on the radio.
: My main interest in amateur radio is emergency communications. I am
: currently using a license study guide to "cram" for an exam (I'm
: testing for element 4B tonight). If I'm going to do the "technology"
: thing, I'm going to need a stack of reference books, a computer, a
: couple of collegues, and a lot of telephone calls. So far, I haven't
: been to an exam session where the VEs would let me use that stuff.
: The people that are going to do "technology," will continue to do
: "technology." I feel that we are not losing "technology," we are
: gaining expertise in other areas (digital communications modes, etc.).

: Just my opinion...

: Tracy

My concern is that the ham fraternity will become a group of communications
people who USE communications equipment rather that a group which is also
^^^
able to use their abilities to keep equipment on the air by whatever means
neccessary during an emergency.

Any paper-shuffling deadbeat yuppie can USE a cellular phone for emergency
^^^

communications, while being barely competent to change its batteries!
Or the Gov. could always give the CB folks some nice 14mhz bandwith to do
international emergency communications.

Breaker 20meters, there Good Buddy! Hows about a radio check...

If that is good enough, why should the FCC bother setting priceless
frequencies aside for the amateur bands?

Why not let UPS buy all they want?

If we don't offer something special, how to do we justify our existance?

I hope my concern is groundless.
We will see.

F = low power pentode
11 = Misc Base

> - DAF11

D = 1.4V Heater
A = Signal Diode
F = Pentode
11 = Misc base

> - DL11

D = 1.4V Heater
L = Output Pentode (or output tetrode, but unlikely)
11 = Misc base

> - UY11
U = 100mA heater (normally put in a series string across the mains)
Y = Half-wave rectifer (one Power diode)
11 = Misc base

>
> On another newsgroup I was informed that these were 1.2V filament tubes

>and that they might not be too easy to come by. Can anybody share some
>additional light? Gee...I wish there was a rec.radio.antique!

Well, D normally means 1.4V heater, but 1.2V is possible. I've mentioned above what they are. You seem to have a Frequency changer (the DCH11), IF amp (DF11), Detector/1st audio (or Detector and 2nd IF) (DAF11), audio output (DL11), mains rectifier (UY11).

I can't find them listed in any UK supplier. They are not easy to find :-((Yes, I wish there was a rec.radio.antique, but I guess we'd never get the numbers :-(. How about an alt.electronics.antique, to cover valve/tube HiFi as well?).

3732. Propane-powered generators

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-17 19:55:58 UTC
From: sas@opus.xyplex.COM
Message-ID: <9306171955.AA05782@opus.xyplex.com>
Source record: 280498

While listening to the noisy generator powering the 6m station during
the VHF contest, a few of us started to talk about generators. One person
commented that LP (liquid propane) powered generators are much more quiet
than gasoline powered ones, as well as having much cleaner emissions.
Since my house uses LP for heat, hot water, etc. I was thinking that an
LP powered generator might be great for backup power, and when coupled
to a typical gas grill LP tank would also work for things like Field Day.
Does anyone have any experience with LP powered generators or know anything
about brands, where to get them, cost relative to gasoline powered units,
etc.

|You bring up a good point. There's also that wonderful DTMF pad on most
|microphones now that you could use to generate a tone. :)

I don't remember the rules in detail (I didn't try this contest), but
if there are separate CW and phone categories, don't they usually have
a rule against cross-mode contacts? Would this count as a cross-mode
contact?

Just wondering

In article <C8r2Hq.4C1@fmsystm.ncoast.org> andrews@fmsystm.ncoast.org (Andrew Sargent N8OFS) writes:
-I need a Field Day question answered ASAP,

-section 8, part A, subpart 9, says:
-VHF/UHF: 100 points can be earned by completing at least 10 QSO's
-(excluding packet contacts) on any band or combination of bands
-above 50 Mhz (VHF/UHF bands) during the Field Day period. A VHF/
-UHF station _(one)_ does not count as an additional transmitter.
-This station is not limited to making just 10 QSO's. It may be
-opperated for the entire field day period and all contacts
-(excluding packet contacts) count for QSO points credit, including
-the first 10.

(I am not from the ARRL, but here is my interpretation...)

: You get one vhf/uhf station free (doesn't increase the number of
transmitters sent in the exchange)

: It is not for packet (that is a separate free station)

: You can use it for the entire field day

: QSOs count 1 point each for phone, 2 for CW, just like on HF

: If you make at least 10 QSOs, you get 100 bonus points

: It can only have one transmitter on at a time (however, the 'station'
can consist of more than one transmitter, with the others turned off)
The 15 minute rule (must remain on one band for 15 minutes) does not
hold above 30 MHz

: It seems to rule out lasers since the 633 nM band is not a ham band,
but this isn't very clear. Remember, that standard contest rules
require electronic (not eyeball) detection... (The same goes for the
CW contacts on the car horns :-)

I have an Onan 6.3LP generator on my motor home. It puts out about
6KW. I've also owned a 5 KW Onan Gasoline version. They both
produce virtually the same amount of noise, which is quite a bit
if you ask me. Most RV parks don't want you running them past 10pm
for this reason.

There is no inherent reason why an LP generator would be one bit
quieter than a gasoline generator. They are really identical engines
in all respects except for the fuel they burn and the way in which
the carburation is handled.

In my opinion, the quietest generators are the small, water cooled
ones (not including diesel).

I can't speak for the cost of operation except to say that LP gas
typically costs $2 to $3 a gallon versus typical gasoline prices.
The "mileage" (judging by LP vehicles) is about the same or worse
than gasoline. I haven't owned my LP generator long enough to
judge its efficiency, it's still got most of the fuel that it had
when I bought it.

|> I assume they are staking out their market for some legal related reason.
|>
|> Anyone know why this is being done?

Usually it's when a suburban station (i.e. licensed to a suburb) wants to sound less provincial and get the attention of the metro area. Usually suburban stations are bought up and "repositioned" as metro stations, sometimes with a power increase. They then often ID as, e.g. Gilroy-San Jose.

The regs on IDs, by the way, say Call Letters and Community of License with the possible interjection of frequency and station ownership. Thus "KFJC 89.7 Los Altos Hills" is acceptable as well. Channel 44 used to ID as "KBHK-TV 44, Kaiser Broadcasting, San Francisco."

It's hip these days, especially at stations with cutesy logos like "Z-104" or "K-FOX" (for KUFX) to do the legal ID between two commercials in the cluster just before or just after the top of the hour. Good on Live 105 for coming right out and owning up to being KITS all the time.

I was at our last Field Day meeting last night before the big day where we tighted up the last loose ends. We will be on top of Mt. Diable in the San Francisco area and will be working 5 transmitters at all times at 150 watts or less. We plan to have transmitters ranging from ATV to 160 meters on at various times of the day and night. Also will be breaking for a BarBque around 6pm to catch our breath. Got me to wondering what other clubs or groups will be doing. We plan to have a lot of fun and hopefully the fog won't blow by at 40 miles per hour like it did last year at night. 8-) So what are rest of my fellow hams up to this coming Field Day? Any good stories of past Field Days out there? 73!

Jeff

That's one of the nice things about the VHF contest -- cross-mode contacts
are OK. Yes, SSB to CW would be a cross-mode contact (though if you sent the
CW via SSB, I wonder what that counts as? :-) I don't think the VHF contest has
separate CW and phone categories, just single-op/multi-op sorts of categories.

Great contest!

fred-mckenzie@ksc.nasa.gov (Fred McKenzie) writes:

>Can any of you experienced 6 Meter operators give me some advice?

Here is some general information about 6 meters that I gathered from
various sources, including personal experience. Additions, corrections,
etc. are welcome.

THE SIX METER AMATEUR RADIO BAND
FREQUENTLY ASKED QUESTIONS

WHAT IS THE SIX-METER BAND? The 6 meter band is a portion
of the RF spectrum allocated to amateur radio. The band
usually behaves like a VHF band similar to 2 meters. During one of
the rare F2 openings, propagation is more like an HF band such as
10 meters. Just about all types of propagation pop up on 6m at one
time or another, which makes the band fascinating to hams.
6m is an acquired taste: a few hams work the band regularly,
but most hams never work it at all.

WHAT ARE THE FREQUENCIES? In the U.S. and some other countries,
the six-meter amateur radio band lies between 50 and 54 MHz, just
below TV channel 2 in the U.S. In some other countries,
6m is allocated much less bandwidth. The U.K. has only
50.0 to 50.1, and New Zealand's band starts at 51.0. Check
your allocations for your particular country.

WAS 6M ONCE TV CHANNEL ONE? Televisions in the U.S. start at
channel 2. Some ham books say that 6m was once channel 1.
This is not true. Just after WWII, Channel 1 in the U.S.
was allocated 44 to 50 MHz. By 1948, interference from police
radios and hams made channel 1 nearly unusable. Early TV sets had
little or no RF sheilding. The ARRL recommended that channel
2 (54-60 MHz) be eliminated, but the FCC decided to axe channel
1 instead.

IS FM USED ON 6M? Yes, but not that often in most areas.
Most 6m enthusiasts use only SSB and sometimes CW.
The main FM simplex frequency is 52.525 MHz. There
are a few 6m repeaters listed in the ARRL Repeater Directory.
Your range is better on 6m than it is on 2m with the same
power a similar antenna.

HOW DO I KNOW IF THERE IS AN OPENING? Of course, the best
way is to check for an opening is to listen to 6m, especially
for the beacons that are listed in the ARRL Repeater Directory.
Monitor 50.110 and 50.125 for SSB openings. You can

also monitor 28.885 MHz, where hams report VHF openings.

WHAT ARE THE MOST POPULAR FREQUENCIES? Per the FCC, 50.0 to 50.1 is reserved for CW work in the U.S. Most operation is SSB. 50.100 is the most popular SSB DX frequency, and 50.100 to 50.124 should be used only for DX. 50.125 is the U.S. domestic calling frequency, and most domestic SSB is found between 50.125 and 50.200. Only during hot F2 openings do you find SSB above 50.200.

DO I NEED A BEAM ANTENNA? If you want to work DX, yes. You can have fun with a vertical during openings, but the pros use beams. Everyone is horizontally polarized, but cross-polarization doesn't matter for Es, F2, or Aurora. A few stations use 3-element beams, but a 4 or 5 element beam is so small that a LOT of people use them. Quite a few people have Cushcraft 6-element "Boomers". There are a few other big beams, and the lunatic fringe stacks them. For example, K6QXY has a stack of 4 six-meter beams, each with a 50ft (15m) boom. The higher the tower the better! RG8 or RG213 is plenty good enough cable for most people. Antenna-mounted preamps are never needed.

IS 6M NOISY? External noise is fairly high at 50 MHz. It overrides the front-end noise figure on about all the rigs on the market today unless you have a LOT of cable loss or a VERY quiet location.

CAN I RUN RADIO-CONTROLLED EQUIPMENT USING 6M? This is legal in the U.S. for licensed hams.

WHAT ARE "GRID SQUARES"? On VHF and up bands, the world has been divided in 1-degree lat x 2-degree long "squares" which start at the south pole and date line and "read right up". SSB stations will always identify their grid square along with their call sign, e.g. "KK6MY DM87". Each square is also divided into sub-squares. European stations like the subsquares; most US stations don't even know their own. In any case, the "squares" and their VUCC awards have been a wonderful interest builder, and have kept the QSL printers in business! Check the ARRL Operating Manual for a map of the grid squares.

WHAT RIGS ARE USED? Probably 50% of the active stations have 80 to 150 W output, either from old Icom 551D s (the 551 is 10W), or from solid-state (brick) amplifiers following the many types of 10W rigs. The Icom 575H is very popular. Perhaps 40% of the stations run just 10 to 20 W, but most of them either get an amplifier or drop out after a year or so. The remaining 10% have tube rigs such as the Drake TR-6. Swan and Heathkit tube rigs should generally be avoided, as they are too drifty. The kilowatt is quite rare on six. The norm for "serious" stations is the 150W amplifier.

CAN I USE A TRANSVERTER WITH AN HF RIG TO GET ON 6M? Yes, but you will either spend a lot of time tinkering with a soldering iron, or you will spend a lot of money on the high-end transverters from SSB Electronics. An SSB Electronics 6m transverter fully equipped will run you $800, but may outperform most of the VHF all-mode rigs. Some hams build transverters, but you need a good level of electronics expertise.

I LISTEN TO 6M OCCASIONALLY, BUT I NEVER HEAR ANYONE. Openings on 6m are rare, especially during low points in the sunspot cycle. For hams in Northern latitudes, openings occur most commonly due to aurora. The most common openings in middle and southern latitudes are a result of sporatic E (Es), which occurs most often in June. F2 openings occur only when the solar flux is high . An explanation of the many types of propagation on 6m follows.

HOW OFTEN ARE THERE F2 OPENINGS? F2 propagation, the kind that we know and love on 20 meters, occurs rarely on 6m. Only at the peak times of the sunspot cycle, a few years out of each eleven, does the band open up for F2. When it does happen, the band becomes a frenzy of activity, and behaves similar to 10 meters. In the last cycle, there were many openings in 1989 through 1991, but that cycle had an unsually long period of peak activity. Openings occur most often in Autumn during the daytime. A few stations have worked 100 or more countries, but they have been patiently working the fleeting openings for many years. The March, 1993 "QST" magazine has an excellent article on 6m propagation that shows a correlation between solar flux and openings.

HOW IS TROPO PROPAGATION ON 6M? The ordinary ground-wave tropo range on six isn't quite as great as on two. There are a number of reasons. Since there are so many other propagation modes on six, people don't try so hard on tropo. Antenna gain often is higher on two. Noise is lower on two. At least in the summer, stations like W3BWU (Pittsburgh), W3IDZ (northern NJ) are easily worked from Maryland with the beam pointing at them, and can be heard at almost any pointing. They are in the 150-W class.

HOW IS METEOR PROPAGATION? Any area workable by meteors can be worked more easily by Es or aurora. Even though meteor bursts are much strong and longer on six than on two, little use has been made of them. There has been a VERY little meteor-burst packet work on six. W3OTC had the first such contact (with W0RPK). W3XO worked him a few years later.

WHAT ABOUT IONOSCATTER? Some people think it's really meteors, but every weekend morning there are a number of nearly-kilowatt stations working each other on SSB at distances of about 600 - 1000 miles by ionosperic scatter. Sigs are weak, and it takes good beams, height, and power, but

it is very reliable. See the old NBS papers by Bailey, Bateman and Kirby, et al. Bateman and Kirby were/are hams. Ross Bateman recently died. Dick Kirby continues as head of ITU in Geneva.

HOW IS AURORA? It is much easier than on 2m. SSB is usually intelligible. Point north about dusk, most commonly in March and October/November. Lots of people in the northern latitudes work this mode when it happens.

WHAT ABOUT SPORATIC E (Es)? You know something about Sporadic E (Es) from TV. When you see interference bars on channels 2, 3,..,6, there is Es DX on six. Having much better antennas, modulation, and receivers, hams work Es when it isn't strong enough to be noticed on the TV. Es is most common in June, but can appear from May to August, and around Christmas, here in Northern latitudes. In addition to the common single-hop range of 500 - 1500 miles, there are quite a few double-and-more hop contacts on six. Now that a number of Europeans are on six, we find that they can be worked from the US east coast each summer. Likewise the Caribbean stations work all over the US. The US west coast can work Hawaii, Alaska, and Mexico. You will also hear some hams on June DXPedition trips to Mexico and the Carribbean; they are easy to work in the late afternoon or early evening, even with 10W and a vertical.

WHAT ABOUT TRANSEQUATORIAL PROPAGATION? - The southern US gets a number of openings to South America by some kind of ionosphericaly-ducted propagation. The stations are generally about equidistant either side of the magnetic equator. Given exceptional luck, an Es opening linked into this mode can make it available to more northern stations. This mode has bad flutter fading and a touch of the auroral spectrum spreading. This mode also works sometimes on two meters if you use CW and really good gear. It has been worked on 432 MHz.

ANY MOONBOUNCE (EME)? - There have been a few EME contacts on six, but the required antenna size and high background noise makes it out of the reach of most people.

WHAT ABOUT TVI PROBLEMS? There is no doubt about it, six has TVI troubles. You don't find a lot of people on six in channel 2 areas unless cable is widely subscribed-to. VCRs are very prone to six-meter pickup. The common connecting or power cable is a quarter-wave antenna for six. The TV owners have their revenge since the 13th harmonic of the color subcarrier, or something, of TV sets and TV games puts out a birdy at 50.113 MHz to bother the six-meter operators in return. There is also quite a bit of trouble from noisy power distribution lines if they aren't buried (usually bad insulators or poor guy bonding).

>Does anyone have any opinions on Coleman's Powermate 4000 watt generators?
>Damark has them on sale for $600 (plus $29 shipping).

I have seen the Coleman powermate ER (extended run) 5000 watt generators
at most every hardware store locally for under $550 and Sams club has
them at $499.

NOTES:
The 10.7 cm solar radio flux is plotted from data reported by the Penticton Radio Observatory (formerly the ARO from Ottawa). High solar flux levels denote higher levels of activity and a greater number of sunspot groups on the Sun. The 90-day mean solar flux graph is charted from the 90-day mean of the 10.7 cm solar radio flux.

CUMULATIVE GRAPHICAL CHART OF SUNSPOT NUMBERS

NOTES:
These VHF DX prediction charts are defined for the 30 MHz to 220 MHz
bands. They are based primarily on phenomena which can affect VHF DX
propagation globally. They should be used only as a guide to potential
DX conditions on VHF bands. Latitudinal boundaries are the same as those for
the HF predictions charts.

3749. Music, Midi and content(Was Re: Digital Microwave...)

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-18 03:04:18 UTC
From: ez006683@othello.ucdavis.edu
Message-ID: <C8sr76.J2w@ucdavis.edu>
Source record: 280515
Cross-posted to: rec.radio.amateur.policy,rec.radio.amateur.misc

1) With the power te ARRL seems to have in the eyes of the FCC I think that the fact that they *specifically* say that midi sequences are only descriptions of and not music itself you are probably pretty safe in assuming that the ARRL didn't just guess that the FCC would interpret it this way. see the 9th printing of the ARRL part 97 guide.

2) I too think it is really none of the FCC's buisness what I am transmitting and I wish that they weren't in the content regulation business.

3) Could rot 13 encoding be considered legal if an unencoded header was included that gave the key and stated that the contents may be objectionable? This would remove the intent to conceal the meaning of the message.

4) Gary, do you read *Reason* ?

Cheers es 73

Went down to the Radio Shack today. If the 404 is as nice as the 202 it looks like another winner. In fact it looks *exactly* like the 202 but with a different model number and antenna. I didn't play with it since I would have been hard pressed not to buy it if I had. And Sue would have locked me out of the house if I did. :-)

Looks good, Paul

Thanks Devon, I have the QRZ CD-Rom but I like having it on-line too!
Is the new search software compatible with your system so we can do
wildcard searches, etc.? If not maybe Fred can supply the code, another
project for your free evenings! :-)

Thanks again,
Dan

From: kylesm@TIGGER.STCLOUD.MSUS.EDU
Message-ID: <1993Jun17.230727.4043@msus1.msus.edu>
Source record: 280344

Hello everyone....
I am looking for some code software for the Macintosh. I have found some on ftp sites, but none of them seem to work (I am using a Mac IIvx with Sys 7.1)

Does anyone know of some good, system-7 compatible morse tutor programs for the mac? Shareware/PD is best, but if you know of a good commercial package that would be OK too, as long as it wasn't too expensive.

73 and TNX,

Kyle Smith N0NYS

True, as long as those three bits of info are included, you're legal.
And it is only required once an hour (Like I said, +/- 5 minutes).

How do I know this?

If I remember right, you can ID as either where your studios are, or
where your transmitter is. I remember at WALE the studios are in
Providence, but the xmtr is in Burrilville (about 25 miles north) and we
always ID'd as Providence.

How about this one Micheal:

"From the top of a REALLY big tower, in a REALLY big swamp, We're
92.3, WCKW, LaPlace, New Orleans, Baton Rouge. "

or

"The station with a million dollar guarantee, you give us a million dollars
and we'll play whatever you want, the TIGER 100.7 WTGE Baton Rouge. "

Two great stations here in south Louisiana.

Charlie

Thanks Scott, for advocating 50 MHz! Unfortunately the new Kenwood TS50
hasn't 50 MHz. When there's a version with additional 6m.... yummie.

By the way, does anyone have an IC-502 on the shelf (may be dusty and rusty).

: Bruce

Bruce, "Bad" language serves well to mark out two sorts of people,
those who are incapable of (or just too lazy) expressing themselves
effectively, and those who just rant away pouring out hatred.

I suspect I'm not alone in having acclimatised to all the usual bad
words, and merely get the impression that whoever is blasting away is
not thinking and so their arguments are likely not worth listening to
so I just "turn off" and never hear whatever they are trying to say.

It's a valuable vent, after breaking something, to just mutter " Oh
bugger" to yourself, but attempts to beef up attempts to influence
the thinking of others seem to be counterproductive.

I don't think there is such a thing as offensive language, I find
some people offensive instead.

To insult someone successfully requires wit and intelligence (and an
audience). To argue an opinion requires wit and intelligence. Some
people don't have wit or intelligence, and it shows !

Laugh at 'em

It has never been the case in ham radio at least since commercial or other equipment sources have been available that everyone in the ham community has been an experimenter or radio builder. It intrigues me that so many people on this group feel that there view of ham radio is the only correct one and that ham is going to "heck in a handbasket" because things are changing.

We have always had a lot of divergence in the things that interest us and we will continue to have it. There are a lot of people (certainly greater in number than earlier in ham history although I don't know if greater per capita) that still build their own stuff. In the above 50Mhz range there is a lot of building and experimenting going on. Below that is a pretty sterile zone for the building activity for radios (given the really good commercial stuff available at fair prices). However, there is still a lot of building of power supplies, amplifiers, transverters, and, of course, antennas.

I have little worry about ham radios future in terms of the many things we are doing and will continue to do plus, of course, all the new stuff that we don't know yet we will be doing. My greatest fear for ham radio has to do with a community that always seems to be tearing at itself, has become increasingly arogant, increasingly intolerant, increasingly malicious, and appears to have more and more people saying that they are the messiahs of the hobby and if only the unwashed masses follow them we can keep it pure and safe for the really good people.

Lets just enjoy what we want in the hobby and not try to force other people to accept our views. Just because our personal vision of the hobby is not universal doesn't mean the hobby is dying. Just because the hobby is changing doesn't mean it is being diminished.

3763. Wanted:Freq.mod. for YAESU 411E

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-18 11:11:40 UTC
From: yngve@due.uib.no
Message-ID: <1993Jun18.111140.16978@alf.uib.no>
Source record: 280330

I'll give it another try with the same questions. A group of Norwegian paraglider enthusiasts are in need of freq.mods for their hams.
Does anybody out there know how to make the handhelt transeiver YAESY 411E transmit in its entire frequency band? From app. 130-174 Mhz. If you know about this mod, please answer to this newsgroup or directly to:
yngve@ii.uib.no
-Yngve Dyvik , Department of Informatics - University of Bergen, Norway

3764. .. or the ICOM IC-P2AT?

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-18 11:26:34 UTC

Source record: 280331

How about the ICOM IC-P2AT? I cannot find any mod for this ham either. As for the previous, I am looking for a freq.mod. that enables the tranceiver to transmit in its entire frequency band, from app. 130-174 Mhz, according to my friends. If you know or know about this mod., please answer to this newsgroup or directly to me. I will reward you with a nice thought.

The calculations of exact breakdown voltages for rectifiers are nice, but don't solve the problem of designing reliable equipment, because the diodes are usually killed by the effects of line transients, not the normal rated line voltage calculated stress.

Some of these transients can have very fast risetimes and kilovolt amplitudes. To reach the secondary of your transformer, they must pass by magnetic or capacitive coupling. The higher voltage members of the 1N400- series are slow, the 1N4007 is very slow. It is a classic mistake for beginners to use 1N4007 rectifiers in switching supplies and to make smoke. These devices are only just good enough for 50-60 Hz use. In the presence of transients, the behaviour of these parts is poor, and not controlled. They can switch late and with a snap. It is amusing to discover that fast diodes are necessary to reduce RFI generated by 50-60 Hz line rectifiers if you are aiming to pass the European radiated and conducted interference tests, as the slow diodes create transients.

I consider high voltage rectifier stacks to be delicate and very susceptible to damage from transients, even after a large iron transformer, you can still see amazing things. I advise deliberate filtering of the incoming power, and transient control measures in the rectifier banks.
The resistor strings bias each diode during reverse bias time so that each has a controlled minimum amount of margin against breakdown. During conduction the voltage across each diode is well defined, during the act of switching off, these voltages have to change, accomodating the difference between the transformer and reservoir voltages. Due to differences in junction capacitance and turn-off time this can momentarily be shared unfairly until the resistors have time to change the distribution of charge to balance the voltages.
You either need very well matched diodes (leak, C, and switch times) or else you need to swamp these effects with R and C.
Remember that some caapacitors can have wide tolerences if intended as HV decouplers, this will spoil the sharing, check them.

The 1N400- series are now folklore parts, God only knows who made most of the ones on sale at rallies. Like the 2N3055 they are standards with easily met specs and could be dies intended to be fancier parts that failed test. I go for higher spec devices properly branded.

I came across a load of "2N3055" that were actually reject die for 50v supply RF power devices. I verified that they met the 2N3055 spec, but with their FT there were few power regulators or audio amplifiers that could use them because of VHF oscillation.

Zener breakdown is a low voltage phenomenom, over a few volts it is usually avalanche breakdown (a different mechanism) both are known to degrade other semiconductor parameters. This shouldn't upset intentional zener/avalanche devices in sensible applications, but if you want a diode to switch reliably as well you are entering territory where many others have had problems.

Hope this helps a bit
David GM4ZNX

>project for your free evenings! :-)

The only implmementation of wild-card searching that I know of requires that the entire database be searched entry by entry. That's great if you have your own little PC but not so great if you're using a multi-user machine donated by a University. The server in its current form is hardly even noticed by our users (which is a good thing). I'm afraid that wild-carding would upset that condition and load up the machine too much.

If anyone knows of a method for doing wild-card searches without a total search of the data, I'd love to hear about it.

Devon

>ID is just the callsign -- No "TV" or "FM" added.

Not always. WSB-TV is WSB-TV, not just WSB. The AM station is just
WSB. In fact, I don't think I've ever run across a TV station that
didn't have TV tacked on to their licensed call. I am aware of several
examples of FM stations with no suffix. And I think all AM stations are
just 3 or 4 letters. When I worked for WJRJ-TV, later WTCG-TV and then
WTBS-TV, there were no associated radio stations, yet the TV was there
on the license documents. Same for WEHT-TV and WFIE-TV and WTVW-TV. Any
examples to the contrary?

3769. Summary: Making home Ham Friendly

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-18 13:32:25 UTC
From: jennings@abb.COM
Message-ID: <9306181232.AA18487@nms1.abb.com>
Source record: 280335

Hello,

A few weeks ago I posted the following:

My friend is thinking about having a house built for him
and he was wondering if you all could offer some
suggestions in making his house "ham freindly". For
instance, having coax run in the walls to his shack or a
rotor mast port in the roof.

I wish to thank the following for their input:

Bob Smits, VE7EMD
Macy Hallock
Marv, KD4EGV
David GM4ZNX
Tom Bodoh
Gary Coffman KE4ZV
Mat Maessen N2NJZ
Scott Sminkey, WO1G

The following is a list of responses:

1. Run four pair twisted pair wire for all telephones, home run
to a central point for all jacks. Use Level 4 wire (less prone
to RFI and xtalk). You can use Shielded Twisted Pair, but it
shouldn't be necessary.

2. Run 2" PVC conduit from the roof, to the prospective
shack location. Stub the conduit thru the roof, using a
vent skirt, put a 180" elbow on the top. Do not glue on
the elbow, though. This run should have no more than
two 90" bends in it. Use 45" bends, if possible.

3. Prepare a support area on the roof structure for a roof
tripod, near the coduit stub. Even if you have use for
a tower, this is a good idea. Its hard to have too many places
to put an antenna.

4. Install Double Shielded RG-59 video cable for the TV runs.
Belden 8232 is a good choice.

5. Arrange for the phone company to install the network interface
inside the house, with the phone line completely buried and not
exposed on the side of the house. Better security and looks nice.

6. Prepare for a grounding system while the house is under construction.
Never, ever skimp on grounding....

7. If you have a basement, run conduit from the shack into the
basement. Useful for standby power (keep the 12v battery in
the basement) and control runs.

8. Wire in remote radion/ music speaker lines. Maybe even prewire some
control station stuff.
(Don't go for a cheap NuTone music/intercom. There are other solutions
that are decent...)

9. Get a professional grade security system installed.
(That's what F.M. Systems does, ask for advice when you are ready)

From: macy@fmsys.fmsystm.ncoast.org (Macy Hallock)

Here are my suggestions:

1. Coax or hardline in walls to antennas.
2. Separate subpanel for all electrical outlets in shack.
3. Additional telephone (multipair cable) pulled to shack.
4. Cable tv drop for shack.
5. Driven ground rod in shack area before concrete floor is poured.
6. Cabling installed in wall for rooftop weather station -even if the
station is added later.

Marv, KD4EGV

For what it's worth, here's what I did when I added a ham shack (closed
in a car port) last year.

Ran a 220 V feed to the new room, and installed a sub breaker panel.

Added electrical outlets everywhere I could concievably want them,
including a 220 outlet for a linear. About 8 of the outlets are switched
by a light switch near the door, to control desk lights, etc.

I prewired a number of telephone jacks - dual ones for the two phone
lines (for the voice and computer lines), at two locations - one at the
computer desk, one near the ham equipment for the phone and patch.
I also added four runs of RG-6 + extra cable through the wall for the
satellite reciever, plus extra shielded audio cables, so that I can feed
the stereo upstairs with satellite audio.

As far as the ham antenna cables go, I would not install the cables
within the wall, as the cables normally get replaced and/or changed
periodically. I made a plywood door in the ceiling of the shack, put coax
feedthrough connectors in it, and feed the cables to the outside between
the rafters. The "door" is directly above the ham gear. (I figure on up
to fifteen separate antenna feeds, all RG-8 or better)

All in all, I recommend adding extra electrical outlets wherever you
could possibly want them. Having a separate sub-panel for the ham shack
will also make it easier to switch in a backup generator, but make

absolutely sure that if this is done, that there is absolutely no way of back energizing the power company's lines with the generator.

If you absolutely must install antenna cables in walls, use conduits, so that you can change them in the future. (Sooner or later, you'll want to.) Provide for antenna cable on every band you may wish to operate on, even if you don't install 'em right away. For me, for example, that makes a total of 4 VHF feedlines, 2 UHF, 8 HF and 2 spares. YMMV.

Plot it all out on paper, and do it several times. There's always something you forgot.

73, Bob Smits, VE7EMD

Robert Smits There is *no* idiotproof filter.
VE7EMD Idiots are proof against anything!
Ladysmith B.C. - Richard Chycoski, VE7CVS
e-mail: emd@ham.almanac.bc.ca

I read the reply about lots of circuits, 220v 110v, bench lamps off of a light switch by door with interest as it breaks my number one safety rule.

Should you ever have an accident, it is likely that the people who would have to try to save you will be unfamilier with your shack, and may never work out which circuit is biting you.

I feel happier in the vicinity of a large switch in a fully insulated plastic box in easy reach of someone entering the shack, with a bright red arrow and the words "safety switch" pointing to it, which kills all power in the shack.

It has never happened to me, so far, and I've designed power supplies as part of my job, BUT should it happen I want the dice loaded to favour me.

For multiple circuits, you'd need a set of ganged switches. It is also a good way to shut down without bothering to find everything that is turned on.

Hope you never need this,

Cheers
David GM4ZNX (everything is on 240v in this country)

I would also suggest ground fault interrupt protection...

++

The only problem with that is that stray RF currents may trigger the GFI system.
Just simply following good grounding techniques should be enough.
--
Mat Maessen N2NJZ | maessm@rpi.edu
------------------------------ +----------------------------------

----

First things first, start with a good ground system. A Ufer ground system
should be installed in the poured footings, and radials should be pre-installed
from the tower pads. Ground window entrance bulkhead panels should be installed
where cable runs will enter the house. This should all be integrated with
the power and telephone ground system to prevent later ground loops. This
is really cheap during construction, and very hard to do right later.

You never pre-wire with enough cables, so conduits with pull ropes should
be installed to all critical areas so that additional cabling can be easily
added later. As a minimum, pre-install in the walls two 50 ohm ethernet/ham
cables and two 75 ohm CATV cables to plates in each room, Also pull multiple
telephone cables and enough power outlets. Don't daisy chain anything. Bring
all phone runs back to a distribution panel, and all CATV and ethernet runs
to other distribution panels. This will allow reconfiguration of the networks
at any future date. The radio room should have it's own cable closet with
conduits, punch blocks, and patch panels.

Use 6 inch walls rather than 4 inch. This will allow larger cable conduits,
and more insulation. For the radio room, there should be computer flooring
and Sonoguard sound treatment. A suspended room inside a room would be best,
but just the sound treatment will help. Shop air should be provided from a
central source, along with a central vacuum system to please the XYL. The
radio room should be on it's own power distribution subpanel, ideally with
full emergency backup and auto switching. Insure plenty of air flow. A
high volume, low velocity, air handling system is best. It will allow
equipment cooling without contributing noise. Avoid metal duct work, use
rigid foam panels for all ducts. This will prevent unwanted resonances
in the air system.

If the neighborhood zoning and covenants allow, freestanding towers are
superior to house mounted antenna masts. If the zoning and covenants don't
allow, consider building in a different location. Naturally, the higher the
site the better for most ham operations. At least two, and preferrably
three, six inch underground cable conduits should be installed from each
tower base to the ground window. These should be fitted with non-rotting
pull ropes and should terminate in weatherproof boxes. Route high level
RF through one conduit, low level RF through another, and control wiring
through the third.

All non-ham electrical equipment should be scrutinized for possible
RFI generation. This includes light dimmers, HVAC controllers, security

systems, major appliances, etc. For more ideas, consult the NAB Handbook.

Tom,

My wife and I had a house built about a year ago and I had a few ham things done that really worked out great. Here you go...

1. Consider where you might put a tower up, where coax from a dipole would fall to the ground, etc. Run buried 4-inch diameter PVC through the basement wall to that point. Use a combination of 22 1/2 or 45 degree bend sections on the outside end to take it out of the ground and bend it over so the opening is facing down (to keep rain out). A plug made of rotproof wood (I used scrap cedar decking material) with holes drilled in it for coax has kept mice from using the PVC to get into the house! This buried PVC has worked out really great to keep from having to string coax thru the air or lying on the lawn.

2. Run PVC inside one of your walls from your basement to your attic. This will give you an easy way to run feedline to any antennas in your attic down to where the radios are. Of course, you have to think about where the shack might be to pick the wall(s) you do this with. Even if you plan on a shack in some place other than the basement, run the PVC from basement to attic in case you change your mind later. If it's an upstairs room, you could attach a PVC tee section to bring it out into the room or just make a note about where the PVC is and punch a hole in the wall later to get at it. Note that having open PVC from basement to attic may be a code violation in some areas because it creates a raceway that can feed a fire. I use a PVC pipe like this to bring feedline from my discone scanner antenna down to the shack in the basement. I think the PVC pipe method is much better than simply putting coax in the walls: you can choose coax type later and replace it at any time.

3. If you've selected a location for the ham shack, have extra wiring put it while you're building (much cheaper than doing it later). Go all out with this because the extra expense isn't much! Put in a 20 or 30 amp 240V outlet for the "big rig" you might get later. Put in a couple of good (20 amp) 120V circuits just for that room. Put the overhead light socket on a different circuit (probably one in common with other room), so if you blow a breaker, you'll still be able to see what you're doing! Think about using a subpanel in or just outside the romm with a master switch for safety purposes.

4. If you're thinking about a tower, now is the time to think hard! It will cost much less now than later to have heavy equipment dig the holes for the base and anchor footings and get the base and footings poured with whatever

rods, pins, rebar frames, base, etc. you'll need. Just think: the equipment and ready-mix concrete trucks will be there already for the big part of the project (foundation, basement walls and floor), so tower stuff is peanuts in terms of extra time and materials. You will need to select a tower type and have a some idea about height to choose dimensions and materials like anchor rods and base plates. I planned for a Rohn 25G guyed installation of 50 to 70 feet.

5. If you're going with a basement shack like I did, drive in a ground rod or two where the room will be before the basement floor is poured, and voila, you've got a ground rod as close as possible to your rigs!

That's all I can think of right now...

Howdy fellow hams....

I'm trying to pin down my 10-10 WAS award, and I have five states left:
Arkansas, North Dakota, Illinois, Michigan and Ohio.

To get those last three I'll probably just have to go mobile, which doesn't
appear to be against 10-10's rules for WAS.

Those first two are proving to be a real pain in the butt, however.

Lately, I've been hearing some short(er) skip on 10M (boatloads of
Colorado stations, mostly) that should put me right in the money for
North Dakota, assuming there's any hams really living there. :-)

(and not just buffalo)

Arkansas? Well, that's a whole other question.

SOOOOOO, we got any 10-10ers out there from N. Dak. or Ark.????? send me
some email if you'd like to give this thing a try......I'd kind of like to
get it all wrapped up BEFORE 10M goes completely to shit.

I've done all the other 45 on my barefoot HR2510 (about 10 watts) between
28.3 and 28.5 phone only, so I'd like to keep it that way, FYI.

The Evans & Sutherland Radio Club will be operating from atop the
Manti-LaSal ridge, elevation 9100', near Fairview Utah. Look for
K6XO 1A Utah on all HF bands (SSB and CW) and 2 meters (FM and SSB).
We will also try RS-12 mode K and maybe RS-10 mode A. Good luck.

But how do you know that the signals aren't coming from a satellite that
orbits the earth at the same orbit as the moon?

Now, if someone had a super power telescope, maybe they could see the flag
we left there (if it is still standing).

Source record: 280343

Ok, now that the political correctness stuff is out of the way, it's time to try to be helpful.

Many of the 1.4v heater receiving valves got pressed into portable radio use after the war. There were quite large collections of new valves left over when old radio repairers retired/moved/went bust. These have been bought up over the years by specialist valve dealers. There has been little demand for the battery set valves as 90-120v batteries made them less popular than mains powered table radios.

There is a British periodical called "Radio Bygones" published by Geoff Arnold (Ex editor of "Practical Wireless") and I would suggest this as a starting point to find dealers or publish a request for help. Geoff will likely try to talk you into sending him details and photos of the radio.

It is easy to tell if a diagram is written in Nazi German, just look for a gothic typeface and heavy use of exclamation marks :-)

Cheers
David

> recommended, if not inexpensive.

I can't seem to find their ads in the two magazines I have. Could you kindly post their address/phone number? I was about to buy some 9913, but will hold off until I check this stuff out. Thanks.

I am installing a repeater in a tall building, and the feedline has to run through 120' of 4" conduit. We tried running 1/2" hardline through the conduit, without any luck. There are four 90-degree elbows the cable has to travel through, and they are inaccessble. The cable has to be pulled through with rope. I am hoping that 9913 will be a little more flexible than 1/2" hardline, and will make the 90-degree turns ok.

I refuse to use RG-8, as it has about 6 dB loss per 100 feet at 440. Someone told me 9913 has close to the same loss as 1/2" hardline, but with the size/look of RG-8. It sounds like the answer to my problem.

3778. synthesizer conversion help needed!

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-18 15:06:08 UTC
From: j_otterson@otters.enet.dec.com
Message-ID: <1993Jun18.150608.7849@jac.nuo.dec.com>
Source record: 280342

Here is a technical question for the PLL/Frequency Synthesizer wizards who I just know are out there...

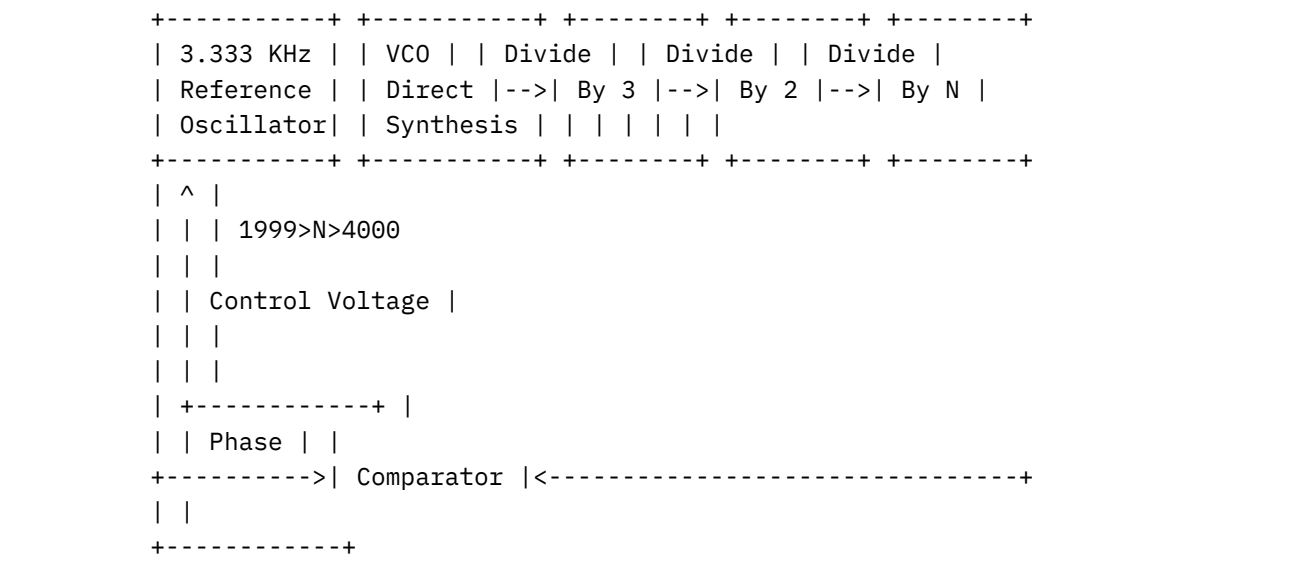
At the Flea last fall, a few folks I know (including myself) bought some Standard Radio C966L VHF Lo-band Mobile Commercial Radios, with the intent of using them on 6. These are 16 channel, 75 watt synthesized rigs, and we all thought it would be "no problem" to convert them for use on 6 meters.

Well, they *do* work on 6, but not on all the channels used by hams. These radios want to have channels on even multiples of 20KHz, i.e. 52.00, 52.02, 52.04, etc. but the 6 meter repeater frequencies are often in *odd* multiples of 20 KHz: 53.59 for example.

So the problem is, how to get the radios to work on either: (A) odd 20KHz channel spacing, or better yet, (B) 10 KHz channel spacing.

PLL Synthesizer Block Diagram and Theory of Operation*
(* at least as I understand it...)

The VCO Frequency is the desired frequency plus 10.7 MHz. It is divided by 3, divided by 2, and then divided by factor "N". The result of all these divisions should be 3.333 KHz, the same as the reference oscillator. If it is not 3.333 KHz, the Phase Comparator makes an adjustment to the VCO control voltage to correct it.



I have come up with the idea of removing the divide by 2 stage, and changing the divide by N stage to allow N to be increased by a factor of 2. This would require changing the divide-by-N chip to a part that would allow a larger divisor... The part that is in the radio now is a 14-bit BCD divide

by N counter. I could use a 12-bit binary divide by n part, which would give me sufficient range, but I cannot determine if such a part even exists...

Another idea that we have tossed around is to change the transmit offset oscillator, and the 2nd IF oscillator to be 10 KHz below their current values, which would meet (A) above, but not (B).

Does anybody have any ideas?

Thanks. Jeff.

I have a friend who is a US citizen living in Europe. He would like to obtain a ham ticket.

1. As a US citizen, is there anyway for him to take the exams (Tech Plus level) in Europe?

2. E.g., any US military based hame clubs in Europe that have VEC's?

3. Could he then use his ticket to operate from Austria or Hungary (where he will be living)? Or does his lack of a US address preclude him from getting a ticket?

Thanks.

I know some people who grew up in mainland China, and they told stories
of literally building from scratch radios and TV sets and actually winding
flyback transformers, deflection yoke coils, using bamboo wrapped in
aluminium foil for antenna rods, and such. How many American hams have
actually wound their own power transformers? We BUY that stuff when we
homebrew. We are just operating at a somewhat higher level. Then there
are the people who construct the packet networks. In their work, radios
and TNCs are considered parts, like the more traditional homebrewer thinks
of resisters and capacitors.
And there are the emergency prepardness and public service guys who use radios
and antennas as just parts for the work they want to do.

I personally have leaned more on the homebrew side more than the public
service area (I used to build radios and stuff, but don't have time for
that anymore). Most of my hamming is on packet BBSs anyway anymore.

Is it true that CBers are allowed to homebrew antennas? You could maybe
get some technically inclined CBer hooked on homebrewing with antenna work,
then say, You can't mess with your CB radio legally (type acceptance
issues), but just study this book, and get the Tech ham license, and we
can mess with lots of different kinds of transmitting stuff.

3788. TV vs Cable Why pay for a free signal?

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-18 17:40:52 UTC
From: WRIGHT%morekypr.BITNET@ukcc.uky.edu
Message-ID: <9306181822.AA01509@ucsd.edu>
Source record: 280359

From the Lexington Herald-Leader News Paper Lexington, Ky. Friday June 18, 1993

3 Central Kentucky broadcast stations asking cable companies to pay for signal

Three of Lexington's four broadcast TV stations took advantage of new federal regulations yesterday and asked a local cable company to give them something in exchange for the use of their signals.

One of the TV stations is wanting cash: 25 cents for each of this companies 72,000 subscribers. Another wants to negotiate but are unwilling to discuss the details. and the 3rd, a FOX affiliate, wants to deal also. If the cable company will carry a new cable channel being developed by FOX, it won't ask for compensation.

The cable company responded to the request by saying: "We have no intention of paying them anything." said program director Patrick Mellon from the company's Norfolk, VA., offices. "The essential issue is whether cable subscribers should have to pay for what non-cable subscribers receive for free."

This one cable company has told broadcasters in other cities where it operates that it will drop their stations rather than pay compensation.

My local cable company is receiving simular requests from the Lexington broadcasters.

Under the regulations, which are part of the cable TV reform law passed by Congress last year, cable operators and TV stations have until October 6 to work out individual agreements. If no agreement is reached the cable companies could:

1. Drop the stations from its lineup and give its subscribers manual switches so they could change back and forth between cable and broadcast TV.

2. Pay whatever fees are requested and at some later date add those fees to subscribers' bills. (There is confusion over whether the law will allow those fees to be passed along.)

3. Absorb the costs, which some operators refuse to do.

The cable operators and the broadcasters all agree that severing the ties between broadcast stations and cable would be a "lose-lose" situation.

My view on this is for all to contact your local cable company and tell them that you are not willing to pay for the signal that you can receive for free and that you would be willing to drop the broadcasters or drop the cable from your home if you have to pay for their service also.

Swamping resistors/capacitors are old technology. Modern diodes don't
require the networks since the manufacturing variances are so low.

SpaceNews originates at KD2BD in Wall Township, New Jersey, USA. It
is published every week and is made available for unlimited distribution.

* OSCAR-20 NEWS *
==================
The Fuji-OSCAR 20 satellite (FO-20) will operate its Mode JA analog
transponder for use during Field Day. This special transponder operation
is the result of discussions between the JARL (Japan Amateur Radio League)
and the ARRL.

OSCAR 20 normally operates its analog transponder on Wednesdays only.
According to Fujio Yamashita, JS1UKR, of the JARL, OSCAR 20's digital
transponder and packet BBS will shut down at 0920 UTC, June 25. The Mode
JA analog transponder will be activated at this time and will remain
available until 1020 UTC, June 28.

The OSCAR 20 analog transponder is available for SSB and CW communications
only. Uplink passband is 145.900 to 146.000 MHz. Downlink passband is
435.900 to 435.800 MHz (inverting).

All amateurs are encouraged to take advantage of this unique opportunity
during Field Day. Our thanks to the JARL for making this possible.

Starting 01-Jan-93, the new QSL Manager for the Mir cosmonauts is RV3DR.
All Mir QSLs should be sent to:

RV3DR-Serge Samburov, Space QSL Manager
P.O. 141070, BOX 73, Kaliningrad-10 city, Moscow Area,
RUSSIA.

or direct:
P.O. 141070, Kaliningrad city, Moscow Area,
prospekt Cosmonavtov, dom 36, kw 96, RUSSIA

Please include return envelopes with your QSL cards.

Mir is back on 145.550 MHz during free periods on the weekends and holidays.
Mir will be off the air during the upcoming SAREX mission.

The cosmonauts work on Moscow time and wake up at 8:00 AM, bathe, and have
breakfast. The remained of their work day is as follows:

9:00 - 12:00 - scheduled work
12:00 - 13:30 - first aerobics, water treatments
13:30 - 14:30 - dinner
15:00 - 18:00 - scheduled work
18:00 - 19:30 - second aerobics, water treatments
19:30 - 20:30 - supper
20:30 - 21:30 - preparing everything for tomorrow's work,
then personal time and 8 hours sleep.

M QST de G3RUH 1993 Jun 10. After 10 days magnetorquing for 17
perigees, the re-orientation is complete. The new attitude is

Alon/Alat 122/0 at 25 rpm. At the poor Sun angle (37 degrees,
80% illumination), which has to be maintained for some weeks,
power balance is marginal, and the low voltage alarm trips frequently.
When this happens, a) the beacon goes OFF and b) the transponder goes
to LOW power. Increasing your uplink e.i.r.p. is futile! 73 James.

N QST 1993 May 31. The transmitter section of Oscar-13's mode-L
transponder appears to have stopped working. No cause has been
established for this. The AGC and Power Output telemetry
both read #FF, and the TX temperature is as per an off
condition. It has exciter power, but possibly not PA power.
Fortunately the mode-L receiver works fine; in conjunction with
mode-S telemetry provides a greatly superior command link than
does mode-B. Thinking continues. 73 G3RUH/DB2OS/VK5AGR.

3791. Re: Field Day, what are others doing?

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-18 18:40:54 UTC
From: mtrail@violet.berkeley.edu
Message-ID: <1vt27m$5d3@agate.berkeley.edu>
Source record: 280358

The UC Berkeley Amateur Radio Club (W6BB) and the Northern Alameda County Ares (NALCO) group plan to run Field Day from the Lawrence Hall of Science above the UC Berkeley campus. We'll probably be 3A this year, with additional satellite and packet stations, plus a novice tent.
Set up is at 9 on Saturday, and we'll run through to the bitter end! A few of us enterprising students (who needs sleep?) will be holding down the fort in the wee hours. We hope to have a lot of fun, and everyone is welcome!!

3792. Cushcraft R7 antenna problem

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-18 18:52:04 UTC
From: younker@bcstec.ca.boeing.com
Message-ID: <C8tz2s.CAn@bcstec.ca.boeing.com>
Source record: 280245

I recently bought a Cushcraft R7 vertical antenna. After assembling it carefully, I put it on the air and found that the SWR on 10 meters is about 1.2 to 1.8, which is great, but on all six other bands, the SWR is 3 to 5 on the phone frequencies. I played around with the lengths of each section, and, on Cushcraft's advice, put a six inch eight turn coil in the coax at the base of the antenna.

None of this helped. The SWR is still high. Has anyone had this problem before me and solved it? Cushcraft is no help at all.

Hi,

Below are some files which contains the mods for the FT411E. I recently
purchased this HT with the mods done and it works well. One note however
my display shows from a range of 100 to 200MHz and I'm not sure if it
actually can recvd that far out-o-band, but definitely txmit only 130-170.

Good luck,
73 KQ4OY - Tom

Subject: ft411 modif's

Date: 6 Feb 89 20:03:02 GMT

copied from packet KD6TH BBS

(Note: I have not tried or verified these mods, proceed at your own risk!)

From: 4X6TL@4Z4SV

Hello to all the owners of the FT-411 OF YAESU,

I have this Hand held, and by playing with it,

I discovered a nice trick to increase it frequency coverage.

It is so simple that you don't even have to open your hand held.

All you have to do is:

1. Make sure that the power switch is off.

2. press the UP arrow and DOWN arrow together, at the same time

(those keys are also called A, and B.

and they placed at the upper right side of the keyped)

3. Keep pressing both buttons and turn the power on.

That's all.

Now you can receive 130-174Mhz, and transmit 140-150Mhz

CAUTON: When you do this modification the memories can be

erased.

Ayhow I think it is not the end, and there are some more

options.

If you do have some more information about this Hand

held,

Please leave me a msg with it.

Tnx, AVIAD, 4X6TL@4Z4SV

Subject: FT-411 Modification.

From: 4X6TL@4Z4SV

Hi everybody.

Here is some new interesting info about the FT-411:

FT 411 OUT OF BAND MODIFICATIONS.

---

1) Open the front cover

2) Locate the C.P.U. unit (it is located on the

front cover).

3) Locate Jumpers 1,2,3 and 4 , These are the

band setting Jumpers

4) Jumpers No 1,2 and 4 should be

disconnected ,and Jumper No 3 should

be connected.

5) Close the radio .

6) Apply power to the radio and turn it

on.

The display will initialize with

memory No 1 flashing and the

frequency display will show

1.000

7) Now , adjust the display to

the desired lowest receive

frequency

When done ,press VFO.

The memory CH will now

show 2 flashing .

8) Adjust the display to the desired highest receive

frequency When done press VFO .

The memory CH will now show 3 flashing .

9) Adjust the display to the desired lowest transmit

frequency

When done ,press VFO.

The memory CH will now show 4 flashing

10)

Now , adjust the display to the desired highest

transmit frequency

When done ,press VFO.

The rig

is now set for your programed band on transmit and receive.

COMMENTS

----

1)

After the rig was programmed to the band and you want to change it

to

other ranges you will have to open the rig again and disconnect

Jumper No 3 then to apply power to the radio ,turn it on again

open it again ,connect Jumper No 3 back and repeat from steps 5 .

Any

comment and other information would be appreciated.

Good Luck

Aviad 4X6TL@4Z4SV

Sb: PTT MOD FOR FT-411

HELLO, A FEW DAYS AGO I WAS USING MY FRIEND'S YASEU FT-411 AND FOUND OUT THIS NEAT TRICK!!! FIRST, A LITTLE BACKGROUND... AS I'M SURE SOME OF YOU KNOW, YASEU CAME OUT WITH THE POPULAR 411 A FEW YEARS AGO. JUST RECENTLY, THEY CAME OUT WITH AN "ENHANCED" MODEL, THE 411-E. THE ONLY FOUND DIFFERENCE IS THE FREQUENCY LOCK OF THE RADIO. THE 411E HAS A FEATURE THAT LETS YOU LOCK THE PTT AS WELL AS THE FREQUENCY.

TO ACTIVATE PTT LOCK ON THE 411:
--TURN RADIO OFF
--PUSH THE 6 BUTTON, HOLD IT AND TURN ON THE RIG WHILE YOUR STILL HOLDING IT.
--NOW, PRESS FM 6, YOU SHOULD SEE "L".
--PRESS FM 6 AGAIN, YOU SHOULD SEE "PTT"(BOTH L AND PTT WILL APPEAR IN THE BOTTEM LEFT CORNER OF THE LCD DISPLAY.

CONGRADULATIONS YOU HAVE INSTALLED PTT LOCK IN UR RIG. TO TURN IT OFF, JUST REPEAT THOSE STEPS.

MIKE-N2LPD @ N2IMC.NJ.USA.NA

Note: I haven't tried or verified this, proceed at your own risk. WA2ISE

Just for grins, I looked up the rules. The following was extracted from
"Pike & Fischer's Broadcast Rules on Disk" Updated 6-1-93

73.1201 Station identification.

(a) When regularly required, broadcast station identification announcements shall be made: (1) at the beginning and ending of each time of operation, and (2) hourly, as close to the hour as feasible, at a natural break in program offerings. Television broadcast stations may make these announcements visually or aurally.

(b) Content. (1) Official station identification shall consist of the station's call letters immediately followed by the community or communities specified in its license as the station's location: provided, that the name of the licensee or the station's frequency or channel number, or both, as stated on the station's license may be inserted between the call letters and station location. No other insertion is permissible.

(2) A station may include in its official station identification the name of any additional community or communities, but the community to which the station is licensed must be named first.

That's what the FCC has to say on the matter!

You're right, Steve, and don't give up on it.

I was unable to sleep last night and flipped on the rig to listen
around on 75m. The first thing I heard (home QTH is in Idaho) was a
station in N. Carolina! He was working a ZK1. I could hear the ZK1
too, and a bunch of four-landers working him after the NC station.

So much for a "dead" band. It sounded more like the middle of February
than June.

3798. favorite remote-pannel dual-bander ?

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-18 21:02:55 UTC
From: baer@hpl.hp.com
Message-ID: <C8u54x.FEs@hplntx.hpl.hp.com>
Source record: 280365

I am planning to buy a dual-band mobile transceiver with a detachable front pannel. I wouldn't mind being able to expand to three bands in the future, but it is not essential. Ideally, I would like the UHF receive coverage to be broad enough to receive local police communications at about 483 MHz.

So what should I buy? I have looked over a few of the alternatives and have come to the following conclusions:

A) ICOM-901 - Meets all requirements. Very expensive. Too few memories per band.

B) Kenwood TM-942, 742 or 732 - Meets all requirements except wide UHF coverage.

C) Yaesu FT-5200 - I have heard that this rig has weak audio. No wide band receive coverage.

D) Alinco ??? - ???

E) Standard ??? - Meets all requirments, but I think the remote microphone stinks. I'd rather mount a remote pannel.

Thanks in advance for your help.

Hey! That gives me an idea for Field Day 1994! Since the Flintstones movie will be in theatres then (starring, among other folks, John Goodman), operating from the site of Bedrock would be appropriate.

Now, it just so happens Bedrock was located in a Los Angeles County Park, so you still get the bonus points for using a public park.

Where was Bedrock? Vasquez Rocks, near Santa Clarita, CA.

> and ultimately results in a failed diode.

Gary-

I'm not trying to start a fight, but Alan is exactly right about the sum of the zener voltages. Your concern about the "damage" being cumulative, has no basis in fact. Zener action in diodes, as well as in the junctions of transistors, is a normal phenomenon that is fairly well understood. As long as the heat generated in the device doesn't exceed its capability to disipate it, no damage will occur. A rectifier diode is usually rated so that the zener voltage is higher than its PRV.

On the other hand, there is the dielectric strength of the materials used to make the diode. Suppose there was some material used in manufacturing the diode, such as an epoxy body, that was subjected to a voltage sufficient to cause a dielectric breakdown. This would also be destructive if current wasn't limited, and some cumulative collection of ions would be expected to build up in the material. However, such a dielectric breakdown would be unlikely to occur at a point lower than the diode's zener voltage. If it did, it would be a sure indication that the epoxy was somehow defective to begin with.

With regard to dielectric strength, what about those resistors you want to put across the diodes? Many of us would use high value half watt carbon resistors without thinking about their 350 volt rating. Even a large two watt carbon resistor is only rated for about 750 volts, as I recall. If you insist in using a resistor across each diode, you must take this into account.

Now, what about the response of a diode string to a fast rise time transient voltage? The voltage spike will divide among the diodes in inverse proportion to their reverse bias junction capacitance. The more I think about this, the less sure I am about what the end result would be. Would the resulting current exceed some instantaneous reverse current or power limit? Or, would the sum-of-zener-voltages analysis still apply? My "feeling" is that use of parallel capacitors to swamp out the junction capacitance, would make the circuit more reliable. Of course, these capacitors' voltage ratings still must be taken into account.

From: collinst@esvx19.es.dupont.com
Message-ID: <1993Jun19.005304.2836@es.dupont.com>
Source record: 280375

On the evening of 6/17 at about 0300Z 5A0RR came up on 14.195Mhz.
He talked to a few stations he had a schedule with then all Hell
broke loose. He started split frequency operation calling on
14.195 and listening 14.200 - 14.300.

Needless to say the thousands of stations in the US and overseas
wiped out 20 meters from 14.150 - 14.300. There were several nets,
one on one QSOs and SSTV QSOs going on. But all of these were
drowned out by the inconsiderate DXers who didn't listen to a frequency
first before transmitting. This went on until about 0345Z when Romeo
went QRT.

On a personal note, I have been licensed since 1978. Was very active
in Dxing for a couple of years then sort of gave up Amateur Radio
to pursue my computer hobby. I got back into HAMing about 4 years
ago and must say that alot of present day Amateur Radio Operators
know nothing of "Radio Etiquette". This is why I gave up DXing and
do more listening now with a few one on one QSOs. Pileups are one
thing, but abusive language, poor operating procedures and total
lack of control is another.

> examples to the contrary?

Sure:

KPIX - San Francisco (ch5)
KATU - Oakland (ch2)
KNTV - San Jose (ch11)
KPTV - Portland (ch12)

How's this for an anomoly? KCBS radio is in San Francisco. KCBS-TV is
in Los Angeles.

Has anyone have any practical experience or opinions on the Fritzel FD4 "Trapless" antenna. The FD4 is supposedly an end fed wire antenna with a rather nifty balun. Supposedly if you have the right length of wire (I think about 21 meters) it will work on all the popular HF ham bands.

Any ideas would be appreciated.

9913 has approximately 3db of loss per 100' at 330mhz. With a 120'
coax run, you're probably looking at appx. 3.5 db of loss.

I'm looking for a keyer and came across two that were for sale.
One is a HD-10 and one is a HD-1410. I don't have a Heathkit cataloge
to look these up.

I remember two: One was kind of long and skinny, with a sloping top.
It was "cream and green", with tubes on the inside. I think it had
an external speaker. The other was smaller, about the size of a
computer keyboard keypad section. It had a grid of numbers and other
selections on the top and the two paddles coming out the front were,
I think, removable.

Is my memory correct? Which model number goes with which? Is there
even another model that I've never seen?

Yes, its time to look somewhere else. I have a Yaesu FT530, and I can hear a birdie
on 146.76. Both with the rubber ducky and the a double copper cactus.

And, I noticed it both at home and at work (with just the ducky). I haven't
tried it away from any computers though. At home I have an Amiga 3000/25 and at
work I have a 486DX/50. I know the monitor at work responds violently to 146.46,
the input frequency to our long range repeater. And, the remote control for my

TV causes hits on 147.060 (the output frequency of the same repeater).

I wonder if cable TV or location to TV stations could be the cause of this. I'll have to make a note to see if I hear it when I'm traveling....

First of all, many thanks to any and all who make the callbook server work and keep it up to date. It's great to see my recent change of address in the database! :-)

One question about the format: It appears that station location no longer appears in the output, as it did automagically with the previous database. Is there some option we can set to make this information appear?

Tnx.

73,
Bob K2PH

3820. TV vs Cable. Why Pay for a FREE Signal

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-19 20:35:24 UTC
From: WRIGHT%morekypr.BITNET@ukcc.uky.edu
Message-ID: <9306192035.AA01270@ucsd.edu>
Source record: 280241

From the Lexington Herald-Leader News Paper Lexington, Ky. Friday June 18, 1993

3 Central Kentucky broadcast stations asking cable companies to pay for signal

Three of Lexington's four broadcast TV stations took advantage of new federal regulations yesterday and asked a local cable company to give them something in exchange for the use of their signals.

One of the TV stations is wanting cash: 25 cents for each of this companies 72,000 subscribers. Another wants to negotiate but are unwilling to discuss the details. and the 3rd, a FOX affiliate, wants to deal also. If the cable company will carry a new cable channel being developed by FOX, it won't ask for compensation.

The cable company responded to the request by saying: "We have no intention of paying them anything." said program director Patrick Mellon from the company's Norfolk, VA., offices. "The essential issue is whether cable subscribers should have to pay for what non-cable subscribers receive for free."

This one cable company has told broadcasters in other cities where it operates that it will drop their stations rather than pay compensation.

My local cable company is receiving simular requests from the Lexington broadcasters.

Under the regulations, which are part of the cable TV reform law passed by Congress last year, cable operators and TV stations have until October 6 to work out individual agreements. If no agreement is reached the cable companies could:

1. Drop the stations from its lineup and give its subscribers manual switches so they could change back and forth between cable and broadcast TV.

2. Pay whatever fees are requested and at some later date add those fees to subscribers' bills. (There is confusion over whether the law will allow those fees to be passed along.)

3. Absorb the costs, which some operators refuse to do.

The cable operators and the broadcasters all agree that severing the ties between broadcast stations and cable would be a "lose-lose" situation.

My view on this is for all to contact your local cable company and tell them that you are not willing to pay for the signal that you can receive for free and that you would be willing to drop the broadcasters or drop the cable from your home if you have to pay for their service also.

OptoElectronics 3000A Product Review - Internet - 18 June 1993
Copyright (c) 1993 Brian Mork

The standard model costs $279 + $10 S&H => $289, available only direct from the manufacturer in Florida. Money well spent? Read on!

>>> ABSTRACT
This 10Hz-3GHz feature-laden counter/timer/frequency meter could be a good addition to your shack if you don't have the functionality yet. There are some disallowed configurations that give you less than you may think if you casually read the laundry list of features. The standard model is the best buy. Assembly could be given more care and input specifications need more attention.

>>> CONSTRUCTION
The case is an extruded U-channel of aluminum with a flat top plate and end plates. The end plates screw into the U-channel with four screws, one of which is a machine screw. This one is by the A input, apparently designed to provide a better "bite" into an interior copper shielding plate around the A input.

A single 9.2cm x 12.6cm circuit board lies under the faceplate, directly mounting the three buttons and six slide switches, which, in turn, poke through the front plate. A piggyback (piggyfront?) board holds the LCD display. There are two main chips--the OE10 vaulted in Optoelectronic's marketing literature and an SC87C51. My 8751 is labeled M1.3000A 5.20.93 VER 2.1 with a little sticky label. The two main chips and a transformer on the board have a white chalky substance around them as if they were hand soldered and the flux vapors weren't cleaned off. Hope it doesn't corrode. Probably 200 additional components, mostly surface mounted, also occupy the circuit board.

The six NiCad batteries are stuck to the back shell (double sided tape?). The two battery wires terminate on the circuit board with a separable connector. The batteries' weight and the solid aluminum case give the unit a solid feel. Neither the wall-wart charging unit or the 3000A itself have a charging light. For the extra resistor and LED, I would like one. Too many times I've had some master switch, wall switch or loose plug inadvertently negate my effort to charge batteries. And when do you find out? When you needed the unit to be charged.

There are three plastic sheets stuck on the external top and face of the unit. My top piece was peeling off slightly. The front bottom one was crooked enough to let Button 2 not bounce back up. Slight trimming fixed that. I can't tell if the white lettering is applied on top of the plas-

tic or behind the plastic. I hope it's behind so that they don't wear off. All the aluminum is painted black --not drippy, but it has the appearance of thick enamel. Personally, I would much rather have black anodized so there would be no possibility of chipping paint.

>>> OWNER'S MANUAL
It's five sheets of photocopied 8-1/2" x 11", printed in landscape mode and folded in half. It's short, but operation of the 3000A is easy, so maybe a lot isn't needed. I would propose inclusion of a few diagrams and tables rather than all linear text description. Included in the manual are:

Features description..... 2 pages
Specifications..... 1 page
Operation..... 2 pages
Data Interface..... 2 pages
Block schematic..... 2 pages
Operation hints..... 4 pages
Battery & Power..... 1 page
Calibration..... 1 page
Warrantee..... 1 page
Service & Return..... 1 page

A loose sheet of paper describes how to turn on the backlight option.

I wanted to know what I could plug into this meter. Nowhere in the specs or owner's manual are the max input ratings. After talking with the factory (toll call is small compared to $300, but still is annoying), I find the 1 Mohm inputs can handle a maximum of 50V. That's combining the peak AC & DC component. It would seem that this has to accept negative voltages, too (because it accepts ambient RF relative to ground), but that's not yet clear. The Model 3000 specified 100VRMS as the maximum. More on this later. Anyhow, I feel good about plugging in TTL.

DON'T plug TTL into the inputs if the 50 ohm switch is selected! More problematic, be sure you *unplug* it before you slide the switch to the 50 ohm position. The 50 ohm inputs (with associated visual bar graph) handle a maximum of +15dBm, limited by the MAR6 amplifier. That's only 31.7 mW, or 39.8mV in a 50-ohm system. However, if this is true, why is the *minimum* voltage (sensitivity) listed as 0.3 - 60.0 mVolt, depending on frequency range? The manual deprives me of information I need to use my meter properly.

For now, I would suggest making no electrical connections to the 50 ohm amps. Only antenna type inputs should be used when the 50 ohm amps are selected. I've wrapped an 8" wire (snake like) around cordless phone antennas, and that works ok, but even this would be *way* to much for a 100W HF transmitter. Be careful and use the bargraph. Full scale bar graph ranges from 2-4 mVolt, depending on the frequency.

>>> OPERATION
Some non-obvious combinations of functions and inputs is the order of the

day. This is kind of weird, but is intentional to give you the best sensitivity possible, using a number of specialized input amps.

Turn it on, holding down a Button 2 if you want the optional backlight to come on. Select either 1 Mohm (Hi-Z) or 50 ohm (Lo-Z) amplifiers.

If you select Hi-Z inputs, Button 1 selects either/both A and B inputs. Button 2 rotates between FREQUENCY, PERIOD, INTERVAL, and RATIO. Button 3 selects the gate time (resolution). Input A measures only 10Hz - 50MHz, with sensitivity of a few tens of mVolts. Input B measures only 10Hz - 10MHz, with a sensitivity of better than ten mVolts.

If you select Lo-Z inputs, a signal strength bar-graph indication automatically appears and you must select one of three input amps:

Input A only, from 10MHz - 220MHz (0.3 to 5mV sensitivity)
Input A only, from ~40MHz - 880MHz (div by 4 prescaler)
Input B only, from 500MHz - 3000MHz (new amp, div by 16 prescaler)

In parallel with all the above, two switches let you operate in either of four modes. I'll call them modes 00,01,10, and 11, representing whether FILTER and CAPTURE, respectively, are off (0) or on (1).

00 (FILTER off, CAPTURE off) Operates as described above. This is the single mode of the original Model 3000. Meter shows updated values even if it's counting noise. Gate light blinks continuously.

10 (FILTER on, CAPTURE off) PERIOD, INTERVAL and RATIO are disabled. Computer logic looks for meaningful oscillations, providing a new frequency value only if a legitimate count is acquired. A higher level of filtering can be selected by holding down Button 3 during power up.

11 (FILTER on, CAPTURE on) Same as mode 10 except nothing happens until you arm the system by pressing Button 2. Once you do this, the word "frequency" flashes on the display until a legitimate count is snagged. A three-memory buffer (the display plus two more) keeps previous values. They are referred to as X, A, and B. X contains the most recent, A the second most recent, and B the third most recent. When a fourth value is snagged, the value in B is lost.

01 (FILTER off, CAPTURE on) In this mode, no measurements are taken. Button 2 rotates between the three memories recorded in mode 11.

>>> PRODUCT SUPPORT
In some sense, there's not much to support. The meter either works or it doesn't. Operation is very straight forward. I don't call to harass service personnel and I *do* read the manuals first. I did call to find out about the input characteristics as discussed above and was, well, not impressed.

Female answers and I ask for service or tech help. After 2 minutes, the line drops dead. I call back. Same female passes me on to Ray quickly this time. I ask Ray about input specs. He says that, yes indeed, that has been inadvertently left out of the manual. Stand by. Three minutes. Ray comes back with info. The 1 Mohm inputs are "plus 50 volt AC plus DC", the 50 ohm inputs are "plus 15 dBm." Yes, that's what I wanted! Follow up: What do you mean by 50v AC+DC?" Hmmm. He didn't know; that's what the engineer told him. Ok. Is it capacitively coupled? Uhh.. the inputs go right into a "MAR6 amplifier." Could you please send me a copy of just the front end prior to the MAR6 amps? Pause... "Well, there's a capacitor that goes to ground." Yes, that's the kind of info I want. What size? Maybe a pf or two? "It's a 50v electrolytic." Eeee wrong person. Would he send me just a copy of the front end schematic? "No, we don't have anything like that I could send you." Ok, well thanks anyhow. Bye.

In retrospect (and perhaps yet), I should have asked (will ask) for the "engineer" who was sourcing this information. Are inputs capacitively coupled? With what size, type & rating capacitor? What in line or parallel resistors (s,t, & r)? What bypass caps, s,t & r? I'll write a letter and hope for more thought out answers from the engineer.

>>> REAL LIFE
I have two regimes of interest for which I want this counter. The first is modem and ultrasonic work in the kHz to 100kHz range. The second is radio VFO work, requiring MHz up to GHz. I characterized the 3000A with a 20Hz - 1MHz function generator and then with my Yaesu 757GX/Vectronics VC300DLP combo.

--- low frequency ---
For the <1MHz work, I stuck with the Hi-Z inputs in order to be able to directly connect to the circuit I'm working on. I have a 1MHz TXCO standard in my shack that has an output floating on the back side of a little toroid transformer. It accepts TTL and gives out approximately +-0.5v into my 500kohm load (3000A and O'scope in parallel). My 1MHz output shows up as a stable 6.00 Mhz on the 3000A. What?! Yes. Regardless of the filter selection (none, medium, or full), six megahertz kept being displayed. The waveform was not symmetric, I'll give that much, but it was very stable and clean from other high frequency hash. It looked sort of like this:
The waveform stayed the same regardless of
|\ |\ whether the 3000A was hooked up. The 3000A
0 V___| -- | -- counted the same regardless of whether the
| | | | o'scope was hooked up. P-P voltage was 1.5v.
-. .---.

The 1MHz output from my TXCO was a square wave ranging between 0 and 2 volts. Regardless of the 3000A filter selection, it showed a frequency of 3.0 MHz.

I fired up the variable freq / variable amplitude function generator and o'scope combination. The generator went to the scope with a BNC T-tap half way that plugged into the 3000A.

Using the A input, I needed incredulously large amplitudes--WAY above the specified <20mVolt. Using the B input was even worse. The procedure used was to start at about 100mV and go down first. If a stable count held, I reduced the PP voltage until spuratic readings were obtained. If 100mV was giving spuratic or known-to-be-wrong numbers, I turned the amplitude up until a stable reading was obtained. The resultant measured PP voltages:

Frequency Input A Input B
20Hz 2V (0.78vRMS) *
200Hz 1V *
350Hz 0.6v *
60KHz 50mV 4V
500KHz <10mV 1V

Square wave counting was similar. For instance, 2V PP was needed at 10KHz to get a good count with Input A. In all cases, the scope showed clean signals with no high frequency hash. Asterisks in the above table indicate I never was able to get a good count.

I own a PK232 radio modem and decided to see if the meter was good enough to tune the audio tones. With full output from the PK232 (about 0.5v PP on the scope, giving 140mV RMS on a Fluke DVM good to 10KHz), I stuck the tones into Input A and Input B with Hi-Z amps selected. The 2200Hz tone showed as 2265+-5Hz and 23KHz, respectively. The 1200Hz tone showed as 1820+-15 and 31KHz, respectively. No, I did not adjust the PK232.

--- high frequency ---
My RF test goal was simple. How accurate is my 757GX VFO? Working near 10MHz, the Lo-Z A input (only one suitable for this measurement) has an advertised sensitivity of <5mV. With a 12" dangling wire near the coax out the back of the radio, the counter was totally dominated with local FM radio stations. It particularly liked one hovering around 104MHz. Later tests 25 miles across town again showed that with a wire pigtail antenna, it was being dominated with this station. I bought an RS15-577B FM trap and put it in line. No difference.

Finally I resorted back to the Hi-Z inputs. At this point I was trying to determine the electrical length of some coax I have (see page 74 ofT the June 93 QST). A 1/4 wavelength of coax is terminated with a short circuit (I used one end of an alligator clip), and this high current node is the point I was trying to pickup the RF. Twenty turns of prototype wire around a pencil stepped up the voltage enough for the meter to register stable counts when the pickup coil was positioned near the end of the coax shorting alligator clip.

Attempts to do PERIOD, INTERVAL, and RATIO measurements were put on hold until I can get answer (or a in-spec meter?) to fix the Hi-Z input sensitivity problem.

>>> OPTIONS
You can buy a precision (0.2ppm vs 1.0ppm) timebase for an extra $100.
You can buy a electroluminescent backlight for an extra $45

--- time base ---
There are two reasons why I did not want to buy the precision time-base option. One is because a RATIO mode is provided and I already have a precision 10MHz TTL oscillator scavenged from an old LORAN navigation board. 10MHz also happens to be the maximum frequency B-input accepted in the ratio mode (all ratios are A/B). What a coincidence. Works for me!

The second reason is simply that the 1ppm timebase is specified to age at a rate of 1ppm/year. A 0.2 ppm option would be degraded to the 1.0ppm option in only about 10 weeks. In any case, I usually don't need to know the last 2 Hz on a 10000000 Hz signal.

--- backlight ---
When it's on, I can hear a switching circuit bringing up a high voltage for the luminescent display. It turns off after 10 seconds of inactivity and comes on again when some button is pressed or frequency is acquired.

It looks good. Worth $45? Not in my opinion. The native display is plenty readable and the extra light actually makes reading it harder from angles "above" the counter.

>>> GOTCHAS
The serial interface is unidirectional. You send it a CR and it sends back 10 digits and a decimal point, in ASCII, 2400bps, 8 bits, no parity, 1 stop bit. It only works in FREQ mode. It provides only the most recent number, with no indication of whether this is another sample or the same number it just sent you after your last request. The interface can sink 1.6mA and source 0.06 mA.

Excellent amplifier sensitivity isn't everything. For decent counting, the signal you're monitoring must exceed the noise (combination of *all* other RF signals in the bandpass of the selected amp) floor by 10-15dB. Specified sensitivity ranges from -27dBm to +19dBm. The input amp is limited to +15dBm. Ambient noise, including FM stations hovers about -11dBm. Play with those numbers and you'll see that amplitude for a good count ranges from non-existent to an 11dBm window. Try to measure a cordless phone near your transmitter or computer monitor? Probably not. If you live near a broadcast station, good luck. Except the required +19dBm input at 3GHz with a +15dBm max rating, I don't consider these numbers a design flaw given the intentionally wide frequency range, but it definitely affects your day-to-day operation.

>>> SUMMARY
If I were to do it again, I'd skip the backlight. $300 for a 3.5" x 5" circuit board seems a lot of money, but the counter is spec'd to do what I need it to do, plus a few options. Resolving the input problems (both the maximum ratings and a reason why my meter is so insensitive) is a must. Does anyone know an FTP site, that has lots of Radio Mod's?

Also, does anuyone have a dual band HT for sale?

3825. Dipoles on Gutters

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-20 00:41:45 UTC
From: martinbw@jackatak.raider.net
Message-ID: <as4e6B1w165w@jackatak.raider.net>
Source record: 280298

In a recent discussion of wire antennas it was suggested that a dipole could be made using 5 conductor rotor control cable and cutting each conductor to tune for different bands and thus eliminate the need for an antenna tuner for these bands. I was wondering if anybody has done this and what would be the affect of running an antenna like this along the gutter of the house (125 ft long 14 ft above the ground).

Thanks
73

>lack of control is another.

This has nothing to do about DXers. Most dxers are the finest ops out there.
These problems arise because of the operator on the other end. The stations
calling are just doing what the dx is telling them to do. If you don't go
by his rules, you wont get the QSO. Therefore flame about Romeo. He could
just as well listen from 14.200 to 14.210 or 14.230 to 14.240 and go
by call areas only. This would help things greatly. Notice, however, that
Romeo uses only a couple kc's on CW. All you anti CW folk ought to take
notice. One or two calls will do it on 14.025 instead of ten or twenty on
14.230...

>my meter properly.

You have made a math error.

dBm = 10*LOG10(Pout/Pin) (for 50 ohm system)

recall power = voltage**2/resistance

therefore:

dBm = 10*LOG10(Pout/(0.22V**2)/50)

or

15dBm = 10*LOG10(((Vout**2)/50)/(0.22**2/50))

which solves to:

Vout = sqrt(50*((0.22**2)/50)*10**1.5) = 1.24Volts

Hello Net.

I have just received a brandnew UNIDEN Bearcat BC 142XL 10 channel scanner.
The problem is it did not come with a manual.
Can anyone help me with programing the channels?
I am interested in scanning the upper 49MHZ and 158-157MHZ.
Naturally I am interested in any modifications available:)

Thanks

Notes of Interest.

KUWAIT, 9K2ZZ. As stated in last weeks bulletin, the QSL information should go to W8CNL

SENEGAL, Guinea Bissau. J5AUI, Mark who has been active on RTTY is now QRT as he had to return the computer to the Embassy. Anyone having a Lap-Top to loan him would be appreciated. His length of stay is until July 1995. The beginning of July, Mark will be active from 6W1 for 5 weeks then back to J5. QSL NW8F.

BELAU, KC6. Look for activity from here 8-13 August as the Kyouto Radio Club of Japan plans a Multi-Op DX-Pedtion, with activity on 10-160 Meters including the WARC bands and RTTY. QSL JA3OIN.

For next weeks bulletin, please direct your Notes and Bandpass to Jules, W2JGR @ CE3GDN.#STGO.CHL.SA

Remember, DX DON'T SLEEP.
GL de Bob, WB2CJL @ CE3GDN.#STGO.CHL.SA

3837. Re: Poor Operating Practice By 5A0RR

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-20 06:25:59 UTC
From: collinst@esvx19.es.dupont.com
Message-ID: <1993Jun20.062559.26973@es.dupont.com>
Source record: 280291

In article <C8wC40.521@acsu.buffalo.edu>, v111qheg@ubvms.cc.buffalo.edu (P.VASILION) writes:

>This has nothing to do about DXers. Most dxers are the finest ops out there.
>These problems arise because of the operator on the other end. The stations
>calling are just doing what the dx is telling them to do. If you don't go
>by his rules, you wont get the QSO. Therefore flame about Romeo. He could

And I disagree that it is the DXers who were doing the interfering.
Just because a DX station says what Romeo did does not give any of them
the right to step on someone else in a QSO. No piece of paper gives
anyone that right.

Well, I stayed up and listened to what sounded like the "Control Op" and
several others after Romeo went QRT. They dropped down to 7.178 and
chatted for about an hour on the operation. This person said that
Romeo should know better than to do what he did about taking up 100Khz
but it wasn't his place to tell DX ops how to operate.

I did hear several other operators on the air who were wiped out by
this operation and many said they would be writing to the FCC and the
ARRL. I wouldn't be surprised if this happens too many more times that
the QSOs be disallowed by the ARRL because of Poor Operating Practice
on part of Romeo and the others ops.

The majority of DX ops don't operate like this but it gives
all hams a bad name and DX ops in this case particularly. Just like what
occurs daily almost on 14.300 and above.

I brought up the subject hopefully to encourage others to listen before
transmitting. Its only common courtesy to others and sets a good example
to the new ops entering the hobby.

73, Tom WI3P collinst@esvax.dnet.dupont.com or collinst@holonet.net

3840. HAM-server help file

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-20 07:06:34 UTC
From: HAMSinfo@GRAFex.Cupertino.CA.US
Message-ID: <gate.N0cF6B1w165w@GRAFex.Cupertino.CA.US>
Source record: 280260
Cross-posted to: rec.radio.amateur.misc,rec.arts.amateur.packet,sbay.hams

All you might ever want to know about the KA6ETB HAM-server

Hardware:
========

386/25 PC clone
Telebit QBlazer modem
20-Meg file space reserverd for archive

Software:
========

Waffle 1.65
WFSmail 2.03

General Information:
===================

Orders for files are filled between the hours of 0200-0400 daily. This is so those hosts through which the traffic is forwarded are not overloaded. Since we all depend on the generosity of others to carry the mail, it behooves us not to make them angry.

ASCII (text) files are split at about 30,000 bytes or 700 lines (which ever comes first). UUENCODED binary files are split at about 750 lines.

If you are using a PC and you do not have UUDECODE, follow these steps:

1. Order UUDECODE.BAS or UUDECODE.C, and UUEXE515.ZIP.
2. Compile UUDECODE.BAS or UUDECODE.C on your system.
3. Use the resulting executable to UUDECODE UUEXE515.ZIP. UUEXE515 has documentation about UUENCODE/UUDECODE.

You are all set to start ordering binary files from HAM-server.

/hamradio/newfiles/ contains files that have not yet been categorized. You can order a list of newfiles by sending the following in an email.

NEWFILES <date>

<date> is in the form of MM-DD-YY, and is required.

If you order a file and do not get it, check the index to be sure you have spelled the filename correctly. If you have ordered the file correctly, then order a new INDEX, as I may have moved the file to a different directory. The system is still expanding, and I am trying to keep it in managable chunks.

Also, if you have ordered files from HAM-server and do not receive them, it might be because your return path is incorrect. My bounce mailbox fills up quite regularly with bounce messages. And, since the path is incorrect, I cannot contact you to let you know.

Orders must be sent to HAM-server. Orders sent to KA6ETB or HAMSinfo are ignored.

A new INDEX is automatically generated every Sunday and when files are moved or added.

Message Command Language:
==========

There are some general rules for ordering files:

o Commands and operands are not case sensitive.

o Leading spaces are permitted before the command. Commands must be the first token on a line.

o A '#' character as the first character on a line is treated as a comment. The line does not cause an error.

o A line beginning with the string "--" is treated as end of input. The remainder of the message is ignored.

The commands are:

GET
HELP
INDEX
NEWFILES
PING
QUIT

The GET Command:

The GET command sends the requested file. The syntax for the GET command is:

GET <filespec> [uue[ncode] | xxe[ncode]]

<filespec> is required. <filespec> must specify a path, but without a drive specification. The filespec is not relative to any directory.

uuencode or xxencode is optional and may be abreviated as "uue" or "xxe", respectively. If neither are specified, the file is sent according to the file extension. Files with these extensions will be sent encoded:

com exe zip pak arc arj gif lzh lha zoo z tar

If uuencode is specified, the file is sent uuencoded.

If xxencode is specified, the file is sent xxencoded.

For example:

GET /hamradio/00-index.txt
GET /hamradio/utility/uuexe515.zip uue

are syntactically correct.

The HELP Command:

The HELP command gets this file.

The INDEX Command:

The INDEX command sends an index of files available from HAM-SERVER.

Use

GET 00-INDEX.TXT

to get a description of the files.

The NEWFILES Command:

The NEWFILES command sends a list of files newer that the user
specified date.

The systax for the NEWFILES command is:

NEWFILES <date>

<date> is required. <date> has the form of mm-dd-yy. HAM-SERVER is
strict about checking the form of <date>; if it does not look like
it expects, the command will be rejected.

A valid specification for the NEWFILES command is:

NEWFILES 02-15-92

The PING Command:

The PING command causes HAM-SERVER make a simple reply, via the
session transcript, to the requestor. To test the path to HAM-SERVER,
send the PING command.

The QUIT Command:

The word "quit" as the first token on a line causes HAM-SERVER to
quit processing input as if end of input had occurred.

3841. rsgb gb2rs news 20th june 1993

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-20 08:28:21 UTC
From: ted@tedb.demon.co.uk
Message-ID: <740564901snz@tedb.demon.co.uk>
Source record: 280276
Cross-posted to: rec.radio.amateur.misc,rec.radio.info

Good morning. It's Sunday the 20th of June and here is the GB2RS news broadcast, prepared by the Radio Society of Great Britain.

First the headlines:- RSGB HQ talk on Radio 5 programme; First ever Tusker Rock amateur radio activity; New RSGB Novice Question and Answer Book available now; Pentland South Pole Explorers honoured.

On the morning of Friday the 11th of June a member of RSGB HQ staff was interviewed by presenter Duncan Goodhew on the hobby of Amateur Radio for a live broadcast on Radio 5's programme "A Couch Potato's Guide to Creative Leisure" at around 9am. Unfortunately the time scale was too short for it to be included in an earlier GB2RS News broadcast.

News now of an expedition by the Bridgend and District Amateur Radio Club to Tusker Rock, situated in the Bristol Channel, some five kilometers south east of Porthcawl. This WAB square (SS87) has never before been activated. For IOTA it is classified under EU124. If weather conditions allow the station will be operating from approx 12 noon on Saturday the 26th of June using the callsign GB2TR. Activity will be limited to 2, 20 and 40 metres SSB only and for a maximum of four hours. If the weather conditions are unfavourable, the next date when tidal conditions will allow landing on the rock will be Saturday the 10th of July. The RNLI, Coastguard and Sea Cadets will all be standing by to evacuate the island if weather conditions deteriorate during the four hours.

The long awaited book 'Revision Questions for the Novice RAE' is now available from RSGB Headquarters. It contains a variety of questions, complete with answers, which cover the syllabus of the Novice Radio Amateurs Examination. It is intended to help candidates to revise and also to become familiar with multi-choice style questions. Included is a sample paper together with further hints and tips on taking the exam. The book is a must for the would-be Novice.

Followers of the Pentland South Pole Expedition earlier in the year will be pleased to learn of the award of OBEs to Sir Ranulph Fiennes and Dr Michael Stroud in the Queen's Birthday Honours List. They were awarded these for their achievement in the field of 'Human Endeavour and Charitable Services'.

Now some items of HF DX news from the weekly RSGB DX News Sheet which is edited by Brendan McCartney, G4DYO. From Gambia, DL7UBA and DL7UTA will be active as C5/DL7UBA and C5/DL7UTA respective from now until Tuesday the 29th of June, on all bands 10 to 160 metres using CW and SSB. From French Polynesia, a group of JA operators will be active from Tuesday the 22nd for one week, on 6 to 160 metres inclusive, using CW and SSB. From Peru, the special call 4T7HP will be aired during Wednesday and Thursday the 23rd and 24th of June to celebrate Andean People's Day. Activity will be on 80 to 10 metres inclusive, using CW and SSB. For CW check first 10kHz of each band and

for SSB check 3680, 7080, 14180, 21280 and 28480kHz. Activity on the WARC bands is also possible. From Thailand, N4TMW will sign N4TMW/HS0 from HS0ZAK's QTH from now until Friday the 2nd of July. Activity will be on 10 to 40 metres, mainly SSB.

Rally news now and we know of three Rallies for today, Sunday, the 20th of June:

The Fourth Annual Belfast Radio Rally is being held at the Chimney Corner Hotel, 630 Antrim Road, Glengormley. It is convenient to the Glengormley turn-off from the M2 motorway. Doors open at 12 noon, 11.30am for disabled visitors. There are trade stands, a bring & buy stall and a lucky dip stand. Refreshments will be available and talk-in will be on channel S22.

Denby Dale And District Amateur Radio Society Annual Mobile Rally is being held at the Shelley High School which is located 6 miles South East of Huddersfield on the B6116. Doors open at 11.00am, 10.30am for disabled visitors. There are the usual trade stands, car boot sale and ample car parking space. Refreshments will be available. Talk-in will be on channels S22 and SU22.

Newbury and District Amateur Radio Society Annual Radio Boot Sale is being held at the Ackland Hall and Recreation Field, Cold Ash, Newbury, Berkshire. The route is well signposted. Event starts at 9.00am. There is free admission and free parking for buyers. Talk-in will be on channel S22 via GB4NBS. Refreshments will be available and a children's play area is nearby.

We know of two rallies for next weekend:

On Saturday the 26th of June, the Wrexham Amateur Radio Society Mobile Rally is to be held at the Annual Steam and Vintage Machinery Show at Plassey, Eyton, near Wrexham on the B5426. The venue is signposted from the A483 Chester - Wrexham Bypass. A fun day for all the family. Talk-in is on channel S22 by GB1WXM. Further details from Ian, GW1MVL on 0978 845858.

And on Sunday the 27th of June, the 36th Longleat Amateur Radio Rally is to be held at Longleat House, Longleat, near Warminster, Wiltshire. Follow the brown signs for Longleat House from Warminster. The organisers of the Longleat Rally are apparently suffering from an incorrect rumour concerning grossly increased entrance prices. These are greatly exaggerated - entrance price is typical for rallies and only slightly up on last year. Rally opens at 9.30am. It features over 150 trade stands; an RSGB bookstall and membership services stand; many national clubs stands; a craft fair and a bring & buy stall. Full catering facilities available on site. Also on display will be items from the Journeaux Historic collection. Camping and caravanning facilities are available nearby. Contact Shaun, G8VPG on 0225 873098 for further information.

Date for your diary.

The RSGB Woburn Rally will take place on Sunday the 18th of July at Woburn Abbey, Bedfordshire. See June Radcom page 40 details. Further information from Norman Miller, G3MVV tel: 0277 225563.

HF contest news now:

The All Asian CW Contest is taking place over this weekend, and will end at 2400 today Sunday the 20th. All bands from 160 to 10 Metres will be used, but excluding the WARC bands. Contest exchange is RST and two figures indicating age. Ladies should send 00. The RSGB Summer 1.8MHz CW Contest takes place over next weekend, from 2100GMT on Saturday the 26th, to 0100GMT on Sunday the 27th. For exchange information see May RadCom page 81.

Now some VHF contest news:

The RSGB 70MHz CW Contest takes place today, Sunday the 20th from 0800 to 1100GMT. See February RadCom on page 66 for details. The VHF National Field Day Contest will take place from 1400GMT on Saturday the 3rd, until 1400GMT on Sunday the 4th of July. See March RadCom page 82 for details.

News now of some special events stations operating during the coming week:

During today, Sunday the 20th, the Radio Club of Thanet will air the callsign GB4SSS to commemorate the 30th anniversary of the Sandwich Bay Sailing and Surfing Club. Details from G3OPL on 0843 597916. On Thursday the 24th, the Hoddesdon Radio Club will operate a Special Event Station from Tolmers Scout Camp, Tolmers Road, Cuffley, Hertfordshire. Operation starts at 6pm, all welcome. For details contact Roy, G4UNL on 081 804 5643 daytime only. During next Saturday the 26th of June, the callsign GB0TPR will be aired by the Meirion (Dolgellau) Amateur Radio Society. The occasion is the annual Three Peaks Yachting / Climbing race. The station will be located at the North end of Barmouth Promenade, near the Coast Guard station. Contact Maurice, GW3GKZ on 0341 422947 for further information.

And now the solar factual data:

The period 7th to 13th June saw a massive solar wind shock wave hit the earth on the 10th, major magnetic storms were forecast but in fact these did not materialise, but very wide spread sporadic E occurred. Openings on 50MHz took place to VE and all over Europe, together with many parts of the middle east. On the 12th and 13th openings to Europe on two metres were reported. Over the period there were a number of M type flares reported, the largest being an M5.4/2B on the 7th with radio sweeps type 2 and 4 which affected the HF bands down to about 10MHz, there have been a number of ionospheric disturbances but most lasted only a few minutes. Spot counts have declined considerably being only 11 on the 13th the lowest number since January 1988, levels meaned about 76. The solar flux has also declined dropping from 115 down to 87 units by the 13th, with the period averaging 104 units, the 87 units on the 13th is the lowest level since September 1987.
The geomagnetic Ap indices rose to sub storm levels of 22 units on the 10th with the Shock wave, but rapidly declined to just unsettled. The period averaged 14.8 units. The state has been flare alert and major storm expected, but was later replaced by nothing to report. The radio quality indices have been poor and have still not recovered from the storms of the 4 and 5 June, levels are still well below normal on most circuits. The aa indices as supplied by the British Geological Survey for the period 1st to the 7th June was mainly unsettled with the daily averages being 36.9 nanoTeslas about K3,

the 1st was very quiet at only 7.3 nanoTeslas and the 4th was very disturbed with periods being up to 116 nanoTeslas about K5. The X-Ray flux shot up to B6.8 on the 10th with the shock wave and remained high up to the 13th when levels declined to B1.3 the period averaged B4.8 units. Bartels rotation 2184 begins on the 24th. The second part of the Lyrids meteor stream is due on the 26th to 29th.

Now the ionospheric data for Central France:

The F2 daytime critical frequencies at Poitiers as reported by Meudon averaged 8.0MHz and the darkness hour lows 4.4MHz. There have been reports of blanketing E lasting up to 5 hours on some days.

Now the ionospheric data for the north:

The F2 daytime critical frequencies at Ekaterinberg averaged 6.4MHz with the darkness hour lows being 4.8MHz. Sporadic E is mainly a summer phenomena and though no direct relationship with any particular solar activity has been established, it is known that the incidence of sporadic E considerably increases during the solar minimum period. Forecasts of possible openings are produced by G3YLA the IARU sporadic E coordinator and displayed on the Packet DX cluster network.

And lastly the solar forecast:

This week, the quiet side of the sun will be moving away, solar flux levels are expected to be about the 110s. Geomagnetic activity is expected to be quiet to just unsettled, periods of Sporadic E particularly on 50MHz are likely. The radio quality indices are expected to be around normal or slightly above.

And that's the end of the solar information.

Finally in the main news, SSL has informed the Society that as of last Wednesday morning, the latest callsigns issued were in the G0 T U and G7 O X series, and Novice calls in the 2 0 A F and 2 1 B Y series.

You're listening to GB2RS, the news broadcasting service of the Radio Society of Great Britain, transmitting in the 80, 40, 6 and 2 metre bands.

3842. Macintosh Amateur Radio Software - June 1993

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-20 11:58:23 UTC
From: tstader@aol.COM
Message-ID: <9306200758.tn04570@aol.com>
Source record: 280263

Macintosh Amateur Radio Software - June 1993

The information in this list was gleaned mostly from flyers supplied by the software vendors, or in some cases from reviews in amateur radio publications or the README files included with the archive. Some of the information has not been verified for a long time; please check with the vendors/authors for the latest product specs, pricing, etc.

NEW/CHANGES: This latest list contains info on KC1SP's latest test stack updates for the new questions for Novice and Technician (just a reminder, effective 1 July 1993), MorseTrainer US-1.0.1b20, Savant 1.0 DEMO, Marathon, IM/Mac 1.0b27m, NET/Mac 2.3.22, Mac MiniMuf and even more information on ftp'able sites carrying Amateur Radio software. Several new items were added at the last moment, more information to follow. Additional e-mail addresses for various authors. New ftp'able site sponsored by the Boston Amateur Radio Club on The World (world.std.com) for both Mac and Apple //. Is ZCo Corporation out of business???

--Collections--
MacNet
Public-domain programs (currently on 12 disks) contributed by Macintosh packet users. Includes test preparation, contest logging, propagation prediction, satellite tracking, and amateur television. Send formatted 800K Macintosh disks with stamped, self-addressed disk mailer to John D. Seney, WD1V, 144 Pepperidge Dr., Manchester, NH 03103. Contributions of public-domain programs are encouraged.

Project Mac
Contest logging, antenna design, satellite tracking, clip art, etc. Microsoft BASIC required for many of the programs. Most of this software is now available in the MacNet collection.
Send three formatted 800K Macintosh disks with stamped, self-addressed disk mailer to Stan Horzepa, WA1LOU, 75 Kreger Drive, Wolcott, CT 06716. (Compuserve: 70645,247)

Amateur Radio Software for Macintosh
Extensive catalog including logging, Morse code, gray line, test preparation, satellite tracking, contesting, and packet radio programs. ZCo Corporation, P.O. Box 3720, Nashua, NH 03061. NOTE: This company has been rumored to be out of business!

Amateur Radio #1
Contains satellite tracking, Morse code, attenuator design, and Ohm's law calculator programs.
Kinetic Designs, P.O. Box 1646, Orange Park, FL 32067.

--Test preparation--
Ham Test Stacks
HyperCard stacks containing the entire question pool for each license class. Can be used for preparation or generating actual tests.
The current releases are: Novice v4.1(new questions eff. 7/1/93), Technician v4.0(new questions eff. 7/1/93), General v2.4, Advanced v2.4, Extra v2.4
If you wish to receive these PUBLIC DOMAIN stacks, please send a SASE (self addressed STAMPED envelope - 2 ounces postage = .52) and 800K diskette to the author: Diana L. Carlson, 3 Spruce Street, Hudson, NH 03051. Diana will no longer send out the stacks unless the envelope has sufficient postage for return mail (in general, that means .52-.98, depending on size of envelope) and for those who send a standard business envelope, she takes no responsibility for the condition of the diskette through US mail.
Available via anonymous FTP from various sites, including uxc.cso.uiuc.edu (/pub/ham-radio). NOTE: The newest releases of Novice and Technician stacks are available at uxc.cso.uiuc.edu (5/6/93) Author is available via Internet: dls@genrad.com

MacHam
Test generators and study aids for the Technician, General, Advanced, and Extra class written elements. Includes the complete question pool for each license.
Coyne Co., P.O. Box 2000-200, Mission Viejo, CA 92692.

--Morse code practice--
N6MZV Morse Trainer
Lets you practice any combination of letters, numbers, and/or punctuation characters. Can send user-created text files.
RT Martin, N6MZV, 10382 Orange Avenue, Cupertino, CA 95014. Also available via anonymous FTP from ftp.apple.com (/pub/ham-radio). Shareware.

Morse Tutor
Sends random groups of letters, numbers, and/or punctuation characters.
Available via anonymous FTP from ftp.apple.com (/pub/ham-radio). Or send formatted 800K Macintosh disk with stamped, self-addressed return disk mailer to Jack Brindle, WA4FIB, 726-175th Street SW, Bothell, WA 98012; Compuserve: 73365,606.

Morse Mania
Designed for those already familiar with Morse code who want to improve their speed. Allows code practice at various speeds and audio pitches. Can generate random sequences or play the contents of user-created text files.
Freeware.
Available via anonymous FTP from whirlwind.stanford.edu (/pub). Contact Edward Plumer, KM6IQ, for more information; Internet: plumer@isl.stanford.edu.

MacMorse
Randomly sends chosen characters. Lets you create your own practice files.
David A. Kall, 700 Marine Parkway #314, New Port Richey, FL 34652.

MacMorse v1.3
MacMorse is designed to help you learn Morse code and improve your receiving

speed. It has several ways that it can send letters and punctuation.
Shareware.
Doug Havenhill, Dynamics and Control, 7143 West Sunnyside Drive, Peoria, AZ
85345.

MacSamuel
Sends random words, random character groups, and user-created text files.
Can also create simulated QSOs with randomly generated text and callsigns.
Avant Systems, P.O. Box 5437, Pittsburgh, PA 15206.

Zihua Morse
Designed to teach Morse code to beginners and to improve the accuracy and
speed of advanced users. Responses can be typed into the computer; the
program will calculate accuracy and timing statistics for each session.
Optional speech synthesizer reads the characters out loud for an accuracy
check.
Zihua, P.O. Box 51601, Pacific Grove, CA 93950.

Sparks-II(f)
More Code training program.
Available for anonymous ftp at rahul.net /pub/davidj/radio

Morse Master 1.0
The newest of the morse code training programs. Looks great - 3/30/93
The author can be reached thru the following e-mail addresses:
nitasaka@mcz.harvard.edu (internet) or enitasak@ddbj.nig.ac.jp (internet).
(Her AOL account is no longer valid - moved back to Japan after her studies.)

MorseTrainer US-1.0.1b20
MorseTrainer is a powerful tool for learning and training Morse code. This
is the first translated version of the program which originally was developed
and localized for Sweden. The program itself can be considered a final
version of v1.0.1 but the translation is probably not perfect, hence a
beta-release instead of final-release.
Features: three different training modes: user text, random text, library
text; arbitrary signal pitch and timbre; arbitrary speed and tempo;
multi-alphabet support; random text generator, text library editor; on-line
alphabet; on-line manual; Help Balloons; and a lot more! FREEWARE!
MorseTrainer will soon be available on a number of different archives such
as sumex-aim.stanford.edu and all its shadow-copies. A swedish version
(S-1.0.1) is available via anonymous ftp using the address 130.235.20.3 in
the mac/swedish/ directory.

--Packet and other digital modes--
NET/Mac 3.2.22
Allows simultaneous TCP/IP, AX.25, and NET/ROM connections. Requires a TNC
with KISS mode. Copyright, but free for noncommercial use.
Available via anonymous FTP from ftp.apple.com (/pub/ham-radio); and on the
Digikron Systems, WB3FFV, and N8EMR dialup BBSs. Or send a formatted 800K
Macintosh disk with stamped, self-addressed disk mailer to Doug Thom, N6OYU,
1405 Graywood Drive, San Jose, CA 95129.
Adam van Gaalen, PA2AGA, (Internet: adam@IGG.TNO.NL) has been making the

modifications to NET/Mac. This version (and others) is available via
anonymous FTP from ucsd.edu (/hamradio/packet/tcpip/pa2aga).

Domain-to-Hosts Converter
This application will create a hosts.net file from the domain.txt file that
PC owners use with NOS. Created by Ken-NS1N is available on many TCP/IP
packet switches in New England.program. Version 1.0r3 is the latest release.

IM/Mac 1.0b27(x)
Mailer program for use with the SMTP protocol. Alternative to the BM program
that comes with NET/Mac. Written by Ivo van Ursel, ON1XK. Ivo is continuosly
updating his mailer program. Check for the latest release in the directory
before "blind" ftp'ing. (Latest release as of 5/26/93 is 1.0b27k)
Available via anonymous FTP from ucsd.edu (/hamradio/packet/tcpip/pa2aga).

SoftKiss 1.6
Control panel device that emulates a TNC running in KISS mode. For use with
packet-radio modems such as the Baycom kit and PacketMac Modem. Available on
the HAMNET forum of Compuserve, America Online and via anonymous FTP from
akutaktak.andrew.cmu.edu (/aw0g).

Virtuoso 1.4
Terminal program that works with TNCs to display packet, RTTY, AMTOR, and
CW. Features a split screen and a type-ahead buffer. Includes a word search
utility, a spelling checker, and a built-in scripting language for automating
routine tasks. Shareware.
Available on America Online, GEnie, and Compuserve. Also available via
anonymous FTP from ucsd.edu (/hamradio/packet/misc), cpre1.ee.iastate.edu
(pub/ke0ph - author's directory) and other sites.
Or send a formatted 800K Macintosh disk with a stamped, self-addressed disk
mailer to James E. Van Peursem,
KE0PH, 4140 Jay Avenue, Orange City, IA 51041; Internet:jvp@iastate.edu.

Savant 1.0
A new packet terminal front-end by the author of Virtuoso. Savant has a
split window interface, but it's also a multi-window, multi-connection
interface and will work with almost any TNC, unlike MacRatt or HostMaster.
A demo version of the product is available at cpre1.ee.iastate.edu
(pub/ke0ph) or via US Mail, send a SAS disk mailer and disk to KE0PH, 4140
Jay Avenue, Orange City, IA 51041.

MacRatt with FAX
Terminal program for use with AEA's PK-232 multimode controller. Supports
packet, CW, RTTY, AMTOR, and facsimile. Includes cable.
Advanced Electronic Applications, P.O. Box C-2160, Lynnwood, WA 98036.

HostMaster
no info yet (hint, hint)

--RTTY--
MacTTY
Decodes Baudot or ASCII transmissions. Can also be used for packet radio and
other digital modes (including landline data communications). Includes split

screen, a 15,000-character type-ahead buffer, and canned messages.
Summit Concepts, Suite 102-190, 1840 41st Ave., Capitola, CA 95010.

WeFaxWorks
Weather facsimile terminal program for use with Kantronics TNCs.
Kantronics rfconcepts, 1202 E. 23rd Street, Lawrence, KS 66046.

--Logging--
Ham Radio Station Logbook
HyperCard stack that stores and displays radio contact information.
Automatically stamps entries with time and date. Contacts can be sorted by
frequency, call sign, or date of contact. Includes report formats, a "Q-code"
reference list, and on-line help.
SanSoft, 892 E. Quail Place, Highlands Ranch, CO 80126. (The same program
appears to be available from Heizer Software, 1941 Oak Park Blvd., Suite 30,
Pleasant Hill, CA 94523.)

FDLog!
Contact logging and duping program. Can transmit any of ten programmable CW
messages. Generates real-time statistics on QSO rates.
System One Control, 3900 85th Ave N, Suite 200, Brooklyn Park, MN 55443.

MacContest 3.5
Allows real-time or post-contest logging of a wide variety of contests.
Checks for dupes, figures scores instantly, and offers various printouts.
Interfaces to TNCs for CW and RTTY contests, to DX packet clusters, to
Kenwood transceivers, and to MacinTalk for easy post-contest entry.
Gerald Eberle, HB9CEY, P.O. Box 13, CH-4417 Ziefen, Switzerland.

LOGic
(Macintosh version scheduled.) Lets you define the rules determining dupes
(such as once per band or once per contest). Displays heading, distance, and
other information about the country being worked. Automatically enters
contact time; if interfaced directly to a radio, also enters the frequency,
band, and mode. Shows status toward earning amateur-radio awards.
User-definable database fields. Exchanges data with other programs.
Personal Database Applications, 2634 Meadow Bend Court, Duluth, GA 30136.

HF Logger 1.2
A real fine HyperCard logging program! (hey... thats all I got!)
N0QGQ

Simple Log .2b
This little utility is a handy way to create a logging file that you can
later import into any data base for analysis, etc. It also shows you that
just about anyone can use Think C and create something on the Mac! Let me
know if you'd like the source code. WD1V @ WA1WOK.NH.USA.NA
Author is John Seney - WD1V, e-mail address is jseney@aol.com. For a copy of
this program, mail a SASE disk mailer and 800K disk to: John D. Seney, WD1V,
144 Pepperidge Dr., Manchester, NH 03103

Marathon
Contesting/logging- Have seen references to (March92 CQ magazine) and heard

good things about MARATHON by N 0 IOS. I believe a demo was available for $8. Last address known is: Kevin Krueger, N0IOS, 1780 Ruth St., St.Paul, MN 55109

--Propagation, gray line, DX headings--
DX Map
Displays a map of the world with the terminator. Gives location, prefixes, zone numbers, distance, and heading for any country you select. Freeware. Requires HyperCard 2.0.
Available via anonymous FTP from joker.optics.rochester.edu (in the /ham/dxmap directory). Or send a formatted 800K Macintosh disk with a stamped, self-addressed disk mailer to Len Saaf, NV2Z, 52 Raleigh Street, Rochester, NY 14620 (Internet: saaf@joker.optics.rochester.edu).

SatTrak
Primarily a satellite tracking program, but also calculates beam headings, Maidenhead grid locations, MUF plots, and band openings. Shareware.
Available via anonymous FTP from sumex-aim.stanford.edu (/info-mac/app). Or send a formatted 800K or 14.MB Macintosh disk with stamped, self-addressed disk mailer to Mike Pflueger, WD8KPZ, 6207 W. Beverly Lane, Glendale, AZ 85306.

Sun Clock
Desk accessory. Displays a color map of the world, including the terminator. Indicates current time for any location.
MLT Software, Inc., P.O. Box 368, Portland, OR 97207.

DX Window
Draws a great-circle world map centered on your QTH, with day/night terminator indicated. Displays over 400 DX locations with prefixes and beam headings.
Engineering Systems, Inc., P.O. Box 939, Vienna, VA 22183.

Skycom 1.1
Enter solar flux and get propagation predictions to desired areas of the world.
Engineering Systems, Inc., P.O. Box 939, Vienna, VA 22183.

Skycom 1.5
Provides sunlight status at both ends of a path; MUF, F0F2, and FOT frequencies; S/N ratio of the link; and other information.
Engineering Systems, Inc., P.O. Box 939, Vienna, VA 22183.

DX Helper
Displays beam heading, distance, gray line, and propagation information. Generates great-circle maps. Identifies prefixes, zones, and oblasts. Includes code practice.
MacTrak Software, P.O. Box 1590, Port Orchard, WA 98336.

Mac MiniMUF
A greyline and propagation predictor based on the PC version of MiniMUF by K4CFV. It is available directly from him for the price of a formatted disk and SASE (disk mailer).

His address in callbook or: Bob Stamper K4CFV, 12510 Shadowrun Blvd., Riverview, FL 33569

--Satellite tracking--
SatTrak
Tracks one satellite across a world map as it moves, displays the instantaneous position of several satellites, or generates tables of all satellites visible from a certain location at a given time. Also calculates beam headings, Maidenhead grid locations, and MUFs. Shareware.
Available via anonymous FTP from sumex-aim.stanford.edu (/info-mac/app). Or send a formatted 800K Macintosh disk with stamped, self-addressed disk mailer to Mike Pflueger, WD8KPZ, 6207 W. Beverly Lane, Glendale, AZ 85306.

MacSat
Tracks up to 21 satellites simultaneously, either in simulation or real-time mode. Text screen displays ground-track coordinates, range, mean anomaly, visibility (azimuth and elevation) and Doppler shift frequency information for all satellites being tracked. Graphical screen portrays the satellite ground tracks superimposed on a world map. Polar plot displays graphically the precise location of each visible satellite above the observer's horizon. Developed by the Geodetic Research Laboratory of the University of New Brunswick.
Available from Richard B. Langley, R.R. 12, Fredericton, N.B. E3B 6H7, Canada.

OrbiTrack
Calculates look angles to selected satellites, plots current satellite positions on a world map, and displays the visible passage of a satellite against background stars (either within the program itself or via a data file that can be read into the Voyager astronomy program).
BEK Developers, P.O. Box 47114, St. Petersburg, FL 33743. (Bill Bard, CompuServe: 75366,2557) (Note: This replaces BEK's previous MacSat program, which was not related to the program of the same name from UNB.)

QuikMac
Macintosh version of N4HY's QuikTrak program. Requires Microsoft BASIC.
AMSAT, P.O. Box 27, Washington, DC 20044.

Satellite Orbit Prediction Program
Macintosh conversion of W3IWI program. Requires Microsoft BASIC.
Send formatted 800K Macintosh disk with stamped, self-addressed disk mailer to Earl Skelton, N3ES, 6311 29th Place NW, Washington, DC 20015. Or send self-addressed stamped envelope for source listing.

Satellite Pro
Uses world maps and tables to indicate rising and setting schedules, current locations, mutual visibility opportunities, and footprints. Includes Mercator, polar, and great-circle displays. Optional antenna control.
MacTrak Software, P.O. Box 1590, Port Orchard, WA 98366.

--Antenna design--
MacMiniNEC

Chris Smolinski, N3JLY, 40 South Lake Way, Reisterstown, MD 21136.

--Radio control--
ICOM Radio Control
Provides a Macintosh interface for controlling ICOM transceivers that use the CI-V remote-control system. Lets you quickly change frequencies and modes. Also does logging and duping. Requires a CI-V to RS-422 converter (schematic included with program).
KE6FG Software, 9763 Pali Avenue, Tujunga, CA 91042.

FreqValet
Provides frequencies and DX program info for shortwave radio listeners. The program databases update automatically at 15, 30, or 60 minute intervals, thus providing a continuous display of broadcasts on-the-air at any given time in a spreadsheet like format. Features include sorting of data, scanning, and on-screen changing of databases. The program will convert Tom Sundstrom's dBase shorwave broadcast listing to FreqValet format and will do the same for Shorwave Navigator users. Separate cards are provided for DX Programs, Ship to Shore, and Utility broadcasts. Computer control modules are available at extra cost for the Drake R8, Kenwood R-5000, JRC NRD-525, and NRD-535 receivers.
DX Computing, 232 Squaw Creek Road, Willow Park, TX 76087. Telephone (817) 441-9188 or (817) 441-5555 (fax).

--Misc--
Macnet Roster HC Stack v356
This is a HyperCard stack that relates all of the hams known that use Macintosh computers. Contact WD1V for more info

--Ham radio BBSs--
Digikron Systems BBS
Various ham-related applications, including logging, propagation, Morse code, and packet. (408) 253-1309.

MacScience BBS
Various ham-related applications, including antenna design, propagation, WEFAX, packet, and Morse code. (408) 866-4933.

N8EMR BBS
Various ham-related files, including packet, DXing, and contesting software; AMSAT bulletins; and several ham newsletters. (614) 895-2553. Also available via FTP on AMPRnet at 44.70.0.1.

WB3FFV BBS
Various ham-related software, including packet, contesting, and Morse code applications. (410) 661-2475, 661-2598, and 661-2648.

ChowdaNet BBS
(more info at a later date)

--Online Services carrying Ham Radio software--
America Online/PC-Link/Promonade
Supports Macintosh, PC's DOS/Windows, PS/1, Apple //s. Ham Radio Club

(keyword = ham radio) supports all computer types. Software for amateur radio, scanners, swl'ers and general electronics. For 10 FREE hours of trial time send your snail mail address to tstader@aol.com or call 1-800-827-6364 Ext. 6285. This site NOT ftb'able(yet). Internet e-mail.

CompuServe
Supports any communications software on most computers Ham Radio area (go hamnet) supports all types of communications formats. Call 1-800-848-8199 for information. This site NOT ftb'able. Internet e-mail.

Delphi
(more info at a later date)

GEnie
(more info at a later date)

Prodigy
Has ham radio message areas, no downloadable software.

==========
Misc. Internet FTP sites for Amateur Radio Macintosh software

joker.optics.rochester.edu (/ham)
sumex-aim.stanford.edu (/info-mac/app)
uxc.cso.uiuc.edu (/pub/ham-radio)
ucsd.edu (/hamradio) many different subdirectories
(/hamradio/incoming) newest files temp holding
area
(/hamradio/packet/tcpip/pa2aga) NET/Mac area
ftp.apple.com (/pub/ham-radio)
akutaktak.andrew.cmu.edu (/aw0g) softkiss-mac
nic.switch.ch (/software/mac/ham-radio)
world.std.com (/pub/hamradio/mac)

If you know of any other sites, please e-mail me info so I may keep this list as up to date as possible!

- Terry

Thanks for all of the notes and updates! Keep them coming. Did I get all of the versions right?

==========
NOTE: Much of this work was done by Patty-N6BIS as she collected information from many vendors. I would like to keep this list as up to date as possible. Please feel free to drop me a note if you have any additional software to this list.

DISCLAIMER: The software listed is not endorsed by Apple Computer, Inc.(c) nor has it all been tested by the author/providers of this information.

>search of the data, I'd love to hear about it.

For decent performance, maintain B-tree indexes that can be searched
quickly with a binary search algorithm.

Gary

>
>True, as long as those three bits of info are included, you're legal.
>And it is only required once an hour (Like I said, +/- 5 minutes).

There's no time limit anymore, It just has to be at a natural break in programming as close to the hour as feasible. For an NBC TV station, or WTBS, that's generally 5 minutes after the hour, but not necessarily, depending on programming.

>If I remember right, you can ID as either where your studios are, or
>where your transmitter is. I remember at WALE the studios are in
>Providence, but the xmtr is in Burrilville (about 25 miles north) and we
>always ID'd as Providence.

You have to identify with the community of license regardless of where studios or transmitters are physically located. Note that the "main" studio facility is supposed to be "in" that community, but it's not required to actually be inside the city limits.

3845. HAM-server index of files

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-20 13:45:43 UTC
From: HAMSinfo@GRAFex.Cupertino.CA.US
Message-ID: <gate.wqVF6B1w165w@GRAFex.Cupertino.CA.US>
Source record: 280264
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.packet,sbay.hams

HAM-server@GRAFex.Cupertino.CA.US

Index of files.

NOTES: ----------

If you order a file and do not get it, check the index to be sure you have spelled the filename correctly. If you have ordered the file correctly, then order a new INDEX, as I may have moved the file to a different directory. The system is still expanding, and I am trying to keep it in managable chunks.

Also, if you have ordered files from HAM-server and do not receive them, it might be because your return path is incorrect. My bounce mailbox fills up quite regularly with bounce messages. And, since the path is incorrect, I cannot contact you to let you know.

Orders must be sent to HAM-server. Orders sent to KA6ETB or HAMSinfo are ignored.

A new INDEX is automatically generated every Sunday and when files are moved or added.

/hamradio/newfiles/ contains files that have not yet been categorized. You can order a list of newfiles by sending the following in an email.

NEWFILES <date>

<date> is in the form of MM-DD-YY, and is required.

The archives may contain the same file under different names. If you should run across one of these, please let me know with email to KA6ETB@GRAFex.Cupertino.CA.US

Or, one gets out the VOM, scope, pyropen, magnifier, and tweezers
and fixes the damn thing. If the bench tech can fix it, so can you,
though it'll likely take you a little longer since you don't do 15
of the same model every day. RF is still RF, and if the problem is
with the microprocessor, you can usually narrow the problem to one
or two chips with just common sense and maybe a scope or logic probe.
Then because the parts are cheap, you can shotgun the suspects. That's
what the bench tech is going to do.

Gary

3848. STS-57 SAREX Launch Postponed

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-20 16:09:28 UTC
From: ABFHB@STDVAX.GSFC.NASA.GOV
Message-ID: <930620120928.21a0ba38@STDVAX.GSFC.NASA.GOV>
Source record: 280270

SB SAREX @ AMSAT $STS-57.003
STS-57 SAREX Mission Postponed One Day

June 20, 1993 @ 15:30 UTC

The launch of the STS-57 Space Shuttle Endeavour was scrubbed today because of weather conditions at the Kennedy Space Center and the Trans-Atlantic Landing (TAL) sights. The launch countdown has been recycled 24 hours. The launch of is now set for 13:07 UTC on June 21. The launch window extends until 14:18 UTC. One of the primary objectives of the STS-57 mission is to retrieve the European Retrievable Carrier (Eureca) satellite which was deployed in August 1992. In addition, the six member crew will carry out numerous middeck experiments which are stored in Spacehab, a new commercially developed middeck augmentation module.

This flight will carry the Shuttle Amateur Radio Experiment (SAREX), a multifaceted amateur radio payload whose primary goal is education. Shuttle Pilot Brian Duffy, N5WQW, and Mission Specialist Janice Voss will be the primary SAREX operators. STS-57 will fly SAREX in configuration C, 2-meter voice and packet. The crew expects to be quite busy with the significant number of payload activities planned for this mission. Thus, packet radio robot contacts are expected to comprise the bulk of the general QSO contacts for this mission.

Prelaunch elements will not be provided for STS-57. The significant number orbit burns required to rendezvous and retrieve the Eureca satellite will cause the prelaunch set to be good only for only the first four orbits. Once STS-57 is in orbit, a definitive set of orbital elements will be provided. Also, since several, significant burns will be performed during this mission, frequent orbital element updates will be required. Some of these orbital burns can cause the predicted orbits to be up to 20 minutes in error for your location. The SAREX working group expects approximately two element sets to be released per day. Please stay tuned to WA3NAN, W1AW, internet, and your local PBBS for the latest Keplerian element sets.

Submitted by Frank H. Bauer, KA3HDO for the SAREX Working Group

/EX

Make that KA6ETB@GRAFex.Cupertino.CA.US. Larry doesn't have an account here (that's a joke, son.).

HAM-server index of files is posted weekly.

Hi

I need mac or unix (for the Sun SPARC) Test Generators.
I do NOT want the Hypercard stacks. These programs must be FTPable
or something like it from INTERNET.

Thank u very much for reading this. Any help would
be appreciated!

3853. non-comunications uses of radio

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-20 19:01:55 UTC
From: I.R.G.Lucas@bradford.ac.uk
Message-ID: <1993Jun20.190155.25456@bradford.ac.uk>
Source record: 280278

Has anyone got any non-communication radio schematics. I am particularly looking for:

1. Radio-controlled switches (transmitter and receiver.) These can be dead simple - no need for electronic coding, but need to be very cheap as the receiver will be disposable.

2: Radio beacon (preferably intermittant) and a corresponding receiver, which can be used for direction finding i.e. homing device.

Are there any ftp sites which have schematics (of any kind)?

3854. Valves for German Radio

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-20 19:03:00 UTC
From: ard@siva.bris.ac.uk
Message-ID: <20JUN199320033725@siva.bris.ac.uk>
Source record: 280277

Last week, someone wanted some information on valves (tubes) for a German wartime radio (will that description keep the PC crowd off my back ? :-)).
I've dug out some data on them from some old valve books, and include it below.
Firstly the bad news. I can find no equivalents listed for any of these, and a quick glance doesn't reveal any other valve with similar properties that could easily be substituted. I can't find them listed in any supplier in England either

All these valves are on an 8-pin base, called a G8a (in the 'Comprehensive Radio Valve Guide Book 2' (Bernards Radio Manuals No 121) or an F8 (in the AVO Valve data manual 1968). Also, they disagree on the pin numbering :

Avo:
7 O
8 O O 6

1 O O 5
2 O O 4
3 O

Bernards:

2 O
1 O O 3

8 O O 4
7 O O 5
6 O

The base is assymetrical, as I have attempted to draw it in ASCII, and is shown from the Underside. I'll use the _Bernards_ pin convention here, as most of my data comes from that book. Anyway, here are some characteristics.
The Avo manual came with my valve tester, and gives the characteristics to be used when testing the valve. The Bernards manual was intended for designers / repairmen, and gives typical working data.
Where the heater is centre-tapped, the data is for both halves in parallel.

3855. Opinions sought on Fritzel FD4

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-20 19:51:39 UTC
From: dihi@bsdihi.atr.bso.nl
Message-ID: <740605899snx@bsdihi.atr.bso.nl>
Source record: 280317

I use a FD 4 in combination with a homebrew 40 mtrs QRP rig
Works beautifull! Get perfect signal reports from all over Europe.
The length of the FD4 is about 40 mtrs though, not 20.
There is a smaller version, with coils, the FD3. I have no experience with
that one.

Dick Hissink PA3DSP

I managed to pick up a Collins KWM-2A in fair condiction but
missing the power supply and the tuning knob. I would like
to restore the unit but have no idea where to get parts and
schematics/documentation.

If anyone knows where I might find parts and paperwork for
this radio, I would be GREATFULL for the help.

Thanks,
John N7XVS

(BTW, anybody know the specs on this radio?)

Landline BBS open to all: (916) 262-1657
RACESBUL.279 DATE: June 21, 1993
SUBJECT: OPS - CRITICAL INCIDENT STRESS
This is a topic we hope you don't experience, but if you do,
perhaps this material may assist.
"Normal emotional reactions and accompanying symptoms
experienced by emergency response personnel as responses to
abnormal events are characterized as critical incident stress.
"Repression of these reactions can be unhealthy, especially
for those who are exposed to this situation time and again.
Agencies where the responders meet this situation repeatedly,
such as the fire service, use critical incident stress debriefing
(CISD). This provides an organized approach in an atmosphere
that allows for emotional ventilation and support, and provides
the information that will allow them to better cope with the
tragedies they may experience (like holding a person who dies in
their arms)."
This came from an article in a CDF publication by Dan
Oliver, CDF Safety Coordinator, who concluded, "...we are all
human beings and we all have feelings which can be deeply scarred
by these traumatic incidents. So talk about it, grieve over it
and know that your being there did make a difference."

Note: Excellent pamplet: "Prevention and Control of Stress Among
Emergency Workers" DHHS Publication No. (ADM) 88-1497, Alcohol,

Source record: 280279

>9913 has approximately 3db of loss per 100' at 330mhz.

The ARRL Handbook says 2.3 db loss per 100' at 330 MHz and 3 db loss
per 100' at 520 MHz. Which is correct? I just bought some for 440.
Is 2.3 approximately 3 or is the Handbook wrong?

>
> 73 de KA6ETB

You're overlooking the obvious.

The actual callsigns are KCBS and KCBSTV. The way the station deals with the physical presentation of the callsign will determine if a 'hyphen' is added.

Recently sold FM Broadcast station KRTH in Los Angeles ID's as K-Earth both by voice and on their billboard ads. However, they do the "correct" ID as KRTH 101.1 MHz Los Angeles as required by the FCC.

Cheers

SB DX @ ALLBBS $OPDX.116
Ohio/Penn DX Bulletin No. 116

The Ohio/Penn Dx PacketCluster
DX Bulletin No. 116
BID: $OPDX.116
June 21, 1993
Editor Tedd Mirgliotta, KB8NW
Provided by BARF-80 BBS Cleveland, Ohio
Online at 216-237-8208 14400/9600/2400/1200/300 8/N/1

Thanks to the Northern Ohio Amateur Radio Society, Northern Ohio DX Association, Ohio/Penn PacketCluster Network, DXMB, DF4RD, AD1C, JR1CTA, 4X6ZK, NA2M, K4CEF & Southeastern Cluster Group, AA7UT, W8GMH, KQ8M, W8XD, K8YVI and K9MK/5 for the following DX information.

3V, TUNISIA. There was a report from 4X6ZK stating a 3V0CW was active on 15 meters CW, June 7th. Operator stated to QSL via JI1STK. WFWL.

5A, LIBYA. By the time you read this, Romeo's operation may be over. The word is that 5A0RR will be QRT on June 21st. DX spots began appearing on the Ohio/Penn Network on June 15th around 2300z by RW3AH on 20 meter CW. By 0030z June 16th, Romeo had a very strong signal on 20 meter SSB and operated until about 0200z before moving to 80 meters. He operated on 80 meters, both SSB and CW, until about 0330z before returning to 20 meters SSB. Romeo QRTed about 0430z on 20 meters SSB and this is the last time stateside has heard him on SSB. Since then, sporadic CW operations with very weak signals have been reported along with mixed reports of possible slims operating (WFWL!). Europeans and Russians state Romeo continues to operate but with a very weak signal.
Now for the RUMORS floating around (remember only RUMORS!). One rumor, from UZ9OWI on the W2MIG net says that Romeo and company are traveling within Libya "on business". Speculation says that his operation may be from a small portable or mobile type setup. A second rumor indicates that he is working a good bit of Europe, but no USA and speculation is that the 5A government may have restricted his operation to exclude the U.S. These two rumors can not be verified until after Romeo's operation. There is a W1AW message being passed along on many of the packet BBS's stating, "Due to the outrageous operating pratices Romeo is utilizing, running 100 kc on 20m, the ARRL DXCC has no choice but to rescind acceptance of these cards for DXCC credit." THIS IS A HOAX! According to Paul, KB1BE, someone unknown to ARRL Headquarters has gotten into their system and set up that statement to forward out. To REPEAT: THIS IS A HOAX!!

E3, ERITREA. JR1CTA reports that JH1AJT, DJ9ZB, K5VT and possibily others will be active June 28 thru July 7. They will be active on 160-6 meters, including the WARCs bands on CW/SSB/RTTY. The call sign is unsure, but it may be something like E31A??. QSL via JH1AJT.

OX, GREENLAND. Mike, N7PQO, will operate this summer from the Greenland Ice Sheet Project 2 (GISP2) camp. This summer encampment of about 40 scientists and technicians are working at the apex of Greenland's ice sheet, some 3,150 meter high. There is in an excess of 3,000 meters of ice thickness, and the primary scientific mission is to obtain an ice core down to bedrock to allow detailed studies of climate conditions over the past 200,000 years. Mike, an atmospheric scientist and middle school teacher from Reno, Nevada, has been assigned the callsign OX/N7PQO. He will be operating SSB daily (as schedule permits) on 14340 kHz at 0100z for general contacts world-wide. Operation dates are approximately June 27 thru August 1. QSL manager is AA7UT, Arthur Johnson, 11060 Fir Drive, Reno, Nv 89506. American ops should enclose, at minimum, an SASE; and overseas hams, at minimum, an SAE and IRC.

PY0S, ST. PETER & ST. PAUL ROCKS. The NATAL DX Group (Brazilian Amateur Radio Group) is planning a DXpedition in January/February of 1994. Four operators will activate PY0SK and PY0SP running two station full time on CW/SSB, all bands (including the WARCs), RTTY, 6 meters (CW/SSB), packet and satellite operations. This will be the first time that packet radio and satellite operations has ever been used on PY0S. Operations will last for three weeks. QSL via PS7KM for SSB, RTTY, 6 meters, packet and satellite contacts. QSL via PT7WA for CW and HF contacts.

TT8, CHAD. Steve, TT8OBO, is active from here. Check around 14256 kHz between 2000 to 2300z. QSL via WA4OBO.

Z3, MACEDONIA. Well, it is time to change your database program again. As of June 17th, the Macedonians have changed their prefixes to Z3.

ZK1, NORTH COOK ISLANDS. ZK1AJJ/ZK1 is very active from here, but mainly on CW. Check between 0200 to 0400z and 1045 to 1230z on 40, 30, 20 and 17 meters. His length of stay is unknown at this time. QSL via JR2KDN.

FAX YOUR DX INFORMATION NOW! Faxing is available Monday/Wednesday/Friday from 0430 to 2330z only. The number is 216-237-8208 and operates Group 3 FAX Service Class 2 (EIA/TIA 592) only. Use only the dates and times specified. FAX Service Class 1 (EIA/TIA 578) is availble upon request by leaving a message to the Sysop on BARF-80 BBS. The FAX card is sharing the same phone line as BARF-80 BBS using a data/fax/phone switch.

Excerpts and distribution of The OPDX Bulletin are granted as long as OPDX/BARF80 receive credit. To contribute DX info, call BARF-80 BBS online at 216-237-8208 14400/9600/2400/1200/300 and leave a message with the Sysop or send InterNet Mail to: aq474@cleveland.freenet.edu or send BitNet Mail to: aq474%cleveland.freenet@cunyvm or send PRODIGY Mail to: DFJH48A or send a message via packet to KB8NW @ WA8BXN.OH.USA.NA

>
> they are hideously noisy and suck fuel like a cheap whore. Otherwise, not
> bad :-)

Honda makes generator sets. The also make special versions that are designed for quiet operation. I run a EX4500S. This one is one of the quiet ones. It is fully enclosed (with 1" fiberglass on steel sound insulation panels), has a muffler about 5 times the size normally used and an oversized airfilter.

Quality doesn't come cheap. The cost on this is in the neighborhood of $2200. Of course, you get some added benefits with this model. Ball bearing races on the crankshaft. Their "Oil-alert" system shuts off the engine if the oil level drops below a safe amount. Large (5 gallon or so) gas tank with an easy to read gas gauge. I also got the remote panel for it. (This goodie is expensive and is not really needed.)

Almost all of the generator sets made by the various manufacturers are rated the same way. PEAK power. Always make sure what the real rated load is and for how long they suggest letting the generator set run. Not all of them are designed for continous operation. Also, the ratings decrease wtih temperature and with altitude.

Finally, remember what the purpose of field day really is supposed to be. Emergency Prepardedness. Not borrowing the Fire Department's Generator when they are obviously going to need it if something actually happens. And being able to REALLY rely on your equipment to work when you need it to. Not the week after when the parts stores are open again.

I've used my generator for the past 3 years on construction sites. Not once has it given me a problem. I guess changing the oil every 24 hours really works. (Hint hint). $3 is not expensive to protect a $2200 investment.

The standard caveat applies: You get what you pay for.

PS to John, hope to hear you on 40 SSB this coming feeding frenzy.

Define "cheap". If fifty bucks falls in that category, wonder
down to you local rip-off-shack (Radio Shack) and get there
super-duper scanner antenna that also works on the ham bands
of 144, 220, 440, 900, and 1200. Hasn't got the gain of a beam
but it "cheap" and simple.

3864. Need sources of Low-Cost, High-Quality Headset/Microphone's !

Hello all;
I am searching for sources of low-cost, high quality headset/microphones. So far, I've only been able to find some sold by Telex, Inc for around $120 each. If I could get the price down to $50 each, I'd be thrilled !!! I will need a bunch of these headset/mic's for use in a intercom system which will be used for an educational project involving area elementary school students.

^^

Wrong. This is the same sort of logic that lawyers use to indict bartenders
for DWI's. No one holds a gun to a DXers head and MAKES them
call on top of nets/qsos/sstv ops. It is the choice of the operator
holding the microphone...

Peter (and anyone else),

The society representing amateur radio in New Zealand is the New Zealand Association of Radio Transmitters (NZART), formed in 1926. NZART publishes an official journal, called "Break-In", monthly except in January. An annual callbook is published with the June issue each year. The callbook covers New Zealand and a number of Pacific Islands, plus other operating information: Awards and contests from NZART and other organisations, repeater and beacon maps, licensing information, bandplans, television stations plus other bits and pieces.

The current subscription to NZART, which includes Break-In, is $NZ65. NZART Callbooks are also available, as are individual issues of Break-In.

For further inquiries, contact NZART Headquarters at one of the following addresses:

NZART Headquarters
Box 40-525
Upper Hutt 6415
New Zealand

Phone: +64-4-528 2170
FAX: +64-4-528 2170 (both phone and FAX the same)

The office is manned from 10-12 am and 2-4 pm weekdays. At the moment, this is 2200-2400 UTC and 0200-0400 UTC.

If you need any further information on NZART or amateur activities in New Zealand, I'd be pleased to assist anyone. In particular, if you're planning a trip I can help you with licencing and repeater information.

>
> Please e-mail any opinions you think would aid my decisions!
>
> --
> jmd@handheld.com

My list of prospective hand-helds includes the following:

Yupiteru MVT-7100
Yupiteru MVT-7000
Radio Shack Pro-43
Uniden 2500XLT (not released yet)
AOR AR-1500
AOR AR-1000
Icom R1
And the classic Uniden 200XLT (AKA 205XLT and Regency 4030)

After doing a lot of comparisons, I am leaning toward the 2500XLT. I
dont think shortwave on a handheld is worth the extra $$. The only
problem with the 2500 is that it is quite large (about 7.5 inches tall).
But with 400 channels in 20 banks and a scan rate of 100 ch/sec, it is
quite attractive. I have the 4030 now, and might just wind up keeping
it. The Uniden and Regency scanners don't do 30Khz spacing.

This happened pretty recently. I filled out a station location on my 610 in March of 1991. When Sue earned her license (February 27, 1993) she wasn't asked for a station location on the 610 and none shows up on her license.

SB SAT @ AMSAT $ANS-170.01
SMALL BUG IN C-64 SUPERTRAK

HR AMSAT NEWS SERVICE BULLETIN 170.01 FROM AMSAT HQ
SILVER SPRING, MD JUNE 19, 1993
TO ALL RADIO AMATEURS BT
BID: $ANS-170.01

KA5OGA Reports A Small Bug Found In Recent C-64 SUPERTRAK Programs

A software bug has been found in a recent set of distribution copies of the popular N4HY SUPERTRAK program for the Commodore C-64 computer. This problem was introduced as a part of the copying process and a very small number, about 20 in total, of the distribution disks were affected.

The disks may be identified by the date of 20-APR-93 on the disk label. The problem appears in QUIKTRAK only, not in MAPTRAK. After answering the "DATA OUT?" and "DATA IN?" prompts, the QUIKTRAK problem exhibits itself as a black screen with a blue border and no text where the main menu should be.

If you are experiencing this problem with a recently acquired copy of the C-64 N4HY SUPERTRAK program and your disk is dated 20-APR-93, you may write or call AMSAT HQ for a one page "Correction Procedures" instruction sheet. The AMSAT-NA address is: 850 Sligo Avenue, Suite 600, Silver Spring, MD, 20910-4703. The the phone number is: (301) 589-6062. Or if you would like KA5OGA to fix your disk directly, please send it to Doug Howard (KG5OA), 2517 Coldstream Drive, Fort Worth, TX 76123.

KA5OGA, the C-64 software copier for AMSAT-NA, sincerely apologizes for any inconvenience the copying error may have caused. And he promises to make sure that all of those little "gremlins" are gathered up and put in their cages before the next round of software copying.

SB SAT @ AMSAT $ANS-170.02
FO-20 IN MODE JA FOR FD

HR AMSAT NEWS SERVICE BULLETIN 170.02 FROM AMSAT HQ
SILVER SPRING, MD JUNE 19, 1993
TO ALL RADIO AMATEURS BT
BID: $ANS-170.02

FO-20 To Be Put Into Mode JA For Field Day Operations

FO-20 continues to operate superbly in both digital and analog modes. Normal analog (Mode JA) operations is still enabled on Wednesdays (GMT)

with digital (JD) operations taking place the remainder of the week.
During Field Day the analog transponder will be enabled from 09:20
25-JUN-93 UTC until 10:20 28-JUN-93 UTC.

Frequencies and modes are as follows:
- Uplink is 145.900 MHz to 146.000 MHz SSB and CW.
- Downlink is 435.900 MHz to 435.800 MHz SSB and CW.

The formula for uplink-to-downlink is as follows:
Downlink Freq = 581.8 MHz - Uplink Freq (MHz) +/- Doppler Shift
(e.g., 581.8 MHz - 145.910 MHz (uplink) = 435.89 MHz (downlink)

For those not familiar with satellite operations, FO-20 is an inverting transponder, and normal operating practice is as follows: CW on lower third of the downlink frequency (435.8 to 435.83 MHz), SSB on the upper third (435.86 to 435.9 MHz), and the middle third is for mixed operations. For SSB operations to uplink on LSB and downlink on USB. Because FO-20 is a Low-Earth-Orbiting (LEO) satellite, contacts can be made using relatively low power rigs (10-25W) and various antenna types. Please note that a receive preamp mounted at the antenna definately helps.

Depending on the orbit and your location in the US, contacts are possible to Canada, the Contential U.S., Mexico, Central America, South America, Greenland, Alaska, Hawaii, and the Carribean.

[The AMSAT News Service (ANS) would like to thank N0NBH for this bulletin item.]

AMSAT OPS NET SCHEDULE

HR AMSAT NEWS SERVICE BULLETIN 170.03 FROM AMSAT HQ
SILVER SPRING, MD JUNE 19, 1993
TO ALL RADIO AMATEURS BT
BID: $ANS-170.03

AMSAT Operations Net Schedule

AMSAT Operations Nets are planned for the following times. Mode B Nets are conducted on AO-13 on a downlink frequency of 145.950 MHz.

Date UTC Mode Phs NCS Alt NCS

26-Jun-93 1800 B 111 W5IU WA5ZIB
10-Jul-93 1300 B 90 WJ9F VE2LVC
17-Jul-93 1800 B 119 VE2LVC W9ODI

Any stations with information on current events would be most welcomed. Also, those interested in discussing technical issues or who have questions about any particular aspect of OSCAR statellite operations are encouraged to join the OPS Nets. In the unlikely event that either the Net Control Station (NCS) or the alternate do not call on frequency, any participant is invited to act as the NCS.

****

Slow Scan Television on AO-13

SSTV sessions will be held on immediately after the OPS Nets a downlink on a Mode-B downlink frequency 145.960 MHz.

WEEKLY OSCAR STATUS REPORTS

HR AMSAT NEWS SERVICE BULLETIN 170.04 FROM AMSAT HQ
SILVER SPRING, MD JUNE 19, 1993
TO ALL RADIO AMATEURS BT
BID: $ANS-170.04

Weekly OSCAR Status Reports: 19-JUN-93

AO-13: ATTITUDE CHANGE
L QST *** AO-13 TRANSPONDER SCHEDULE *** 1993 Jun 10 ->
Mode-B : MA 0 to MA 15 !
Mode-S : MA 15 to MA 25 !<- S transponder; Mode-B trsp. is OFF
Mode-B : MA 25 to MA 256 ! Attitude
Mode- : MA ! (approx)
Mode- : MA ! Jun 28 140/0
Omnis : MA 170 to MA 10 ! Jul 12 150/0
Please don't uplink on Mode-B during MA 15-25 because this will interfere with the Mode-S users. [G3RUH/DB2OS/VK5AGR]

MIR: Two Russian cosmonauts, Guennadi Manakov (U9MIR) and Alexandre Polechtchuk (R2MIR), await the arrival 02-JUL-93 of a new crew aboard the MIR space station. The new crew will be made up of a two Russians and a Frenchman. The new crew will be Vasily Zibliev (R3MIR) and Aleksandr Poleschuk (R4MIR) and Jean Pierre Haignere, (callsign uknown). It is still not certain yet whether Jean will be active from the MIR hamshack. The new MIR crew will be very busy performing Extra Vehicular Activities (EVA) on 18-JUL-93. The new crew will be installing some electronic controls to the solar panels to the Kvant astrophysic module and will also be performing some functional equipment check-outs aboard MIR. Look for the cosmonauts to be active on 145.550 MHz or on packet in the weeks following the their arrival of the new crew on 02-JUL-93. [LW2DTZ]

AO-10: This week KD8PH heard AO-10 on a low pass when it was approximately 8,000 miles away from his QTH, slant range, and was able to get into the Mode-B transponder. Despite calling CQ, he did not hear any stations on the downlink return his call. He reminds everyone that AO-10, at times, puts out a very good signal and he feels hams should not "count-it-out." [KD8PH]

AO-21: KD8PH notes that AO-21 was very busy this week on its FM transponder mode. Uplink is 435.016 MHz and downlink is 145.989 MHz FM. [KD8PH]

The AMSAT NEWS Service (ANS) is looking for volunteers to contribute weekly OSCAR status reports. If you have a favorite OSCAR which you work on a

regular basis and would like to contribute to this bulletin, please send your observations to WD0HHU at his CompuServe address of 70524,2272, on INTERNET at wd0hhu@amsat.org, or to his local packet BBS in the Denver, CO area, WD0HHU @ W0LJF.#NECO.CO.USA.NOAM. Also, if you find that the current set of orbital elements are not generating the correct AOS/LOS times at your QTH, PLEASE INCLUDE THAT INFORMATION AS WELL. The information you provide will be of value to all OSCAR enthusiasts.

Worth trying, I suppose. I believe that although many US valve types migrated eastwards, few European ones went westwards. It may be necessary in the end to try European sources.

Posted-By: auto-faq 2.4

How to find the Rec.radio.amateur.misc Frequently Asked Questions list
---

This article will tell you how to find the answers to frequently-asked Questions (FAQ) from rec.radio.amateur.misc. The FAQ articles are posted on the 7th of each month. This article is posted on the 14th, 21st, and 28th of every month as a reminder of where to find the FAQ.

The FAQ articles are intended to summarize some common questions on the rec.radio.amateur.misc newsgroup and Info-Hams mail list as well as to help beginners get started.

Besides the monthly posting, the FAQ is always available via anonymous FTP and from e-mail servers. This article contains instructions for obtaining a copy of the FAQ. It also contains the table of contents from the FAQ so that you know which questions are covered by it.

Please provide a copy of the FAQ to any new or soon-to-be Hams you know.

Regular FAQ postings can help save network bandwidth and maintain a good signal-to-noise ratio in the newsgroup. However, they can't do it alone - you, the reader, have to use them. If you are a new user, please print and review the FAQ articles and look at the instructions in the news.newusers newsgroup before posting any articles. If you are an experienced user, please help by refraining from answering frequently-asked questions on the newsgroup if they are already answered by the FAQ articles. Instead, send e-mail to the user who asked the question. (It will be helpful if you include the part of the FAQ that answers their question, but not the whole thing.)

--How to obtain a current copy of the FAQ---

There are 3 ways to obtain a copy of the FAQ.
1) NetNews
2) Anonymous FTP
3) An Electronic Mail Server

Option #1: NetNews

If you are familiar enough with NetNews to look through previous articles on your system, Option #1 above may be the easiest for you. The FAQ is posted so that it should not expire from your site's news spool until the next one is posted. Unfortunately, some news administrators do not honor the expiration dates meant to preserve the FAQ.

Look in rec.radio.amateur.misc, rec.radio.info, rec.answers, or news.answers.
If the FAQ has expired at your site, try Option #2 (and ask your news
administrator to honor expiration dates for articles cross-posted to
news.answers if he/she can.)

Option #2: Anonymous FTP

Anonymous FTP uses the File Transfer Protocol. It is only available to sites
which are directly connected to the Internet. If you don't know how to use
FTP and can't find a friend to help you, continue to Option #3. If your site
is not connected to the Internet, you should also continue to Option #3.

The following sites have copies of the FAQ:
site name & address path to FAQ articles
------------------- --------------------
ftp.amdahl.com pub/radio/amateur/faq.[1-3].Z
located in western USA, updated daily when changes occur
ftp.cs.buffalo.edu pub/ham-radio/faq_ham_[1-3]
located in eastern USA, updated monthly
rtfm.mit.edu pub/usenet/news.answers/ham-radio-faq/part*
located in eastern USA, updated monthly
contains news.answers archive - most UseNet FAQs are here
grivel.une.edu.au pub/ham-radio/buffalo/ham-radio/faq_ham_[1-3]
located in Australia, updated monthly (mirror of Buffalo)
nic.funet.fi pub/ham/info/faq_ham_[1-3]
located in Finland, updated monthly

Remember, when connecting to the remote system, use the login name of
"anonymous" and, as a courtesy to the site administrators, your e-mail address
for the password.

Option #3: Electronic Mail Server

If you can't use Options 1 or 2, your only remaining option is electronic mail.
You can retreive a copy of the FAQ by sending a message to
mail-server@rtfm.mit.edu

The body of your mail will contain a command for the mail server software.
To get all of the FAQ (consisting of 70K of e-mail in 3 parts), place the
following in the subject of your message:
send usenet/news.answers/ham-radio-faq/*

To obtain just one part, substitute the part number for the "1" in the
following example:
send usenet/news.answers/ham-radio-faq/part1

Leave out the subject of your message because the mail server will ignore it.

--- begin sample mail message ---
To: mail-server@rtfm.mit.edu
From: me@here.org
Date: Mon Aug 14 22:27:33 PDT 1995

send usenet/news.answers/ham-radio-faq/*
--- end sample mail message ---

3877. U.K. 6m Band

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-21 10:22:52 UTC
From: pdu@unixa.nerc-barry.ac.UK
Message-ID: <19732.9306211022@ua.nrb.ac.uk>
Source record: 280301

Not so long ago someone said that the U.K. 6m band
only went from 50.0 to 50.1. This is incorrect
it goes from 50.0 to 52.0. According to the bandplan
SSB calling is on 50.200, but I've yet to hear any
stations there. Intercontinental DX calling is on
50.110.

3878. Re: 6M multi-hop Es to the US

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-21 10:28:07 UTC
From: magne@ddm3.ddm.st.statoil.no
Message-ID: <1993Jun21.102807.4638@statoil.no>
Source record: 280302

To broaden things a little. Here is a follow-up from the
European side:

Randall Rhea (randall@informix.com) wrote:

: THE SIX METER AMATEUR RADIO BAND
: FREQUENTLY ASKED QUESTIONS

: WHAT ARE THE FREQUENCIES? In the U.S. and some other countries,
: the six-meter amateur radio band lies between 50 and 54 MHz, just
: below TV channel 2 in the U.S. In some other countries,
: 6m is allocated much less bandwidth. The U.K. has only
: 50.0 to 50.1, and New Zealand's band starts at 51.0. Check
: your allocations for your particular country.

In Europe, ch. 2 is 48 to 54 MHz, so the 6m band falls into the TV
band. There have been made decisions on an European level to
abandon ch.2, but because of the high number of low-power repeaters
that use ch.2 as input it takes a while.

U.K has more bandwidth than suggested here. They have at least
50.000-50.500. Most european countries have 50.000-52.000.

: WHAT ARE THE MOST POPULAR FREQUENCIES? Per the FCC, 50.0 to
: 50.1 is reserved for CW work in the U.S. Most operation is
: SSB. 50.100 is the most popular SSB DX frequency, and 50.100
: to 50.124 should be used only for DX. 50.125 is the U.S. domestic
: calling frequency, and most domestic SSB is found between 50.125
: and 50.200. Only during hot F2 openings do you find SSB above 50.200.

Do not forget 50.110

: CAN I RUN RADIO-CONTROLLED EQUIPMENT USING 6M? This
: is legal in the U.S. for licensed hams.

Legal in Norway too...

: WHAT RIGS ARE USED? Probably 50% of the active stations have 80
: to 150 W output, either from old Icom 551D s (the 551 is 10W), or
: from solid-state (brick) amplifiers following the many types of 10W
: rigs. The Icom 575H is very popular. Perhaps 40% of the stations run
: just 10 to 20 W, but most of them either get an amplifier or drop
: out after a year or so. The remaining 10% have tube rigs
: such as the Drake TR-6. Swan and Heathkit tube rigs should
: generally be avoided, as they are too drifty. The kilowatt is
: quite rare on six. The norm for "serious" stations is the 150W
: amplifier.

Several European countries have power limitations due to the number
of ch.2 transmitters. Other limitations include maximum height
of tower, max. gain of antenna and max. total ERP. Norway has
an ERP limit of only 60W.

: CAN I USE A TRANSVERTER WITH AN HF RIG TO GET ON 6M? Yes, but
: you will either spend a lot of time tinkering with a
: soldering iron, or you will spend a lot of money on the
: high-end transverters from SSB Electronics. An SSB Electronics
: 6m transverter fully equipped will run you $800, but may
: outperform most of the VHF all-mode rigs. Some hams build
: transverters, but you need a good level of electronics expertise.

It's far easier to build a 6m xverter than it's 2m counterpart.
If you have the crystal, a couple of SBL-1's and a few other
parts, it can be built in less than a night :-) Total cost
approx: NOK 200 ($60). The one thing to think about is if
you choose 28 Meg as the IF, the 56 Meg is pretty close
(and the 44 Meg) (twice the IF and twice the LO)

: working the fleeting openings for many years. The March, 1993
: "QST" magazine has an excellent article on 6m propagation
: that shows a correlation between solar flux and openings.

A closer correlation can be found between openings and
the sun-spot number, I think. The Flux will give a nice
indication though.. (and it's easier to get the flux than
the SSN)

: HOW IS METEOR PROPAGATION? Any area workable by meteors
: can be worked more easily by Es or aurora. Even though meteor bursts
: are much strong and longer on six than on two, little use has been
: made of them. There has been a VERY little meteor-burst
: packet work on six. W3OTC had the first such contact (with
: W0RPK). W3XO worked him a few years later.

In Europe, there are lots of activity on MS. Since the bursts are
rather long, SSB are more used than on 2m. High-speed CW
(1000-1500 lpm) is also very popular. Es is mainly a late spring and
mid-winter activity, so MS is used the rest of the year. Even with
a low power station 50-60W ERP, 1800-2000 km is no problem.

3880. RE: Making home HAM Friendly

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-21 12:26:00 UTC
From: beerb@ccmail.dayton.saic.com
Message-ID: <beerb.18.0@ccmail.dayton.saic.com>
Source record: 280303

I don't think that putting in ground rods through the poured concrete
floor of the ham shack is a good idea, as proposed by several people.
The earth will provide a good ground as long as some moisture is available -
but given time, the earth under your house will be pretty dry. You
certainly want a short run to the ground rod, but put it outside of the
house. Preferably, in virgin earth outside of the roof's "drip line", where
rain can get to the soil. A heavy braided cable will provide a good signal
ground. Bond the signal ground (per the National Electrical Code) to the
main electrical ground.

<<BRAD>>

3881. Re: TV vs Cable. Why Pay for a FREE Signal

>From the Lexington Herald-Leader News Paper Lexington, Ky. Friday June 18, 1993
>
>Three of Lexington's four broadcast TV stations took advantage of new federal
>regulations yesterday and asked a local cable company to give them something
>in exchange for the use of their signals.
>
>One of the TV stations is wanting cash: 25 cents for each of this companies
>72,000 subscribers. Another wants to negotiate but are unwilling to discuss
>the details. and the 3rd, a FOX affiliate, wants to deal also. If the cable
>company will carry a new cable channel being developed by FOX, it won't ask
>for compensation.

Note that 25 cents is what WTBS charges cable companies to carry it's
signal, and always has.

>The cable company responded to the request by saying: "We have no intention of
>paying them anything." said program director Patrick Mellon from the company's
>Norfolk, VA., offices. "The essential issue is whether cable subscribers
>should have to pay for what non-cable subscribers receive for free."

Cable subscribers are *already* paying for what others receive for
free. It's in the basic cable charge. The only question is whether
local broadcasters should get a cut just like the non-broadcast and
"superstation" originators do. Right now the cable companies have a
free ride on the programming costs absorbed by the broadcaster while
"pirating" away his broadcast audience and charging *them* for it.

From: bsieker@techfak.uni-bielefeld.de
Message-ID: <C8z3Ds.KBw@hermes.hrz.uni-bielefeld.de>
Source record: 280305

I am just lookin for the same thing, but I would like it for the Amiga Computers. I've had some CW training programs that worked to some extend, but they were all written in this poor AmigaBasic, so none of them works any longer since I got a higher processor and OS revision.

So I would appreciate, if anyone could point me to such a program, preferably freely distributable. It would be nice, if the program can also test your abilities to send morse sigs yourself, instead of only training the listening abilities. (With the Joystick firebutton, which could easily be replaced by a Junkers key.

From: ehare@arrl.org
Message-ID: <1616@arrl.org>
Source record: 280310

```
W1AW Schedule

Time (EST) Mode Days
---------- ---- --------------------
12 AM RTTY Daily
12:45 AM VOICE Daily
9 AM CWs Wed, Fri
9 AM CWf Tue, Thu
10 AM CWb Tue-Fri
11 AM RTTY Tue-Fri

4 PM CWf Mon, Wed, Fri
4 PM CWs Tue, Thu, Sat, Sun
5 PM CWb Daily
6 PM RTTY Daily
7 PM CWs Mon, Wed, Fri
7 PM CWf Tue, Thu, Sat, Sun
8 PM CWb Daily
9 PM RTTY Daily
9:45 PM VOICE Daily
10 PM CWf Mon, Wed, Fri
10 PM CWs Tue, Thu, Sat, Sun
11 PM CWb Daily

Frequencies (MHz)
-----------------
CW: 1.818 3.5815 7.0475 14.0475 18.0975 21.0675 28.0675 147.555
RTTY: 3.625 7.095 14.095 18.1025 21.095 28.095 147.555
VOICE: 3.99 7.29 14.29 18.16 21.39 28.59 147.555

Notes:
CW frequencies include code practices, Qualifying Runs and CW bulletins.
CWs = Morse Code practice (slow) = 5 - 7.5 - 10 - 13 - 15 WPM
CWf = Morse Code practice (fast) = 35 - 30 - 25 - 20 - 15 - 13 - 10 WPM
CWb = Morse Code Bulletins = 18 WPM
RTTY= Teleprinter Bulletins = BAUDOT (45.45 baud) and AMTOR-FEC (100 Baud).
110 Baud ASCII is sent as time allows.

Code practice texts are from QST, and the source of each practice is given at
the beginning of each practice and at the beginning of alternate speeds.

On Fridays, UTC, a DX bulletin replaces the regular bulletin transmissions.

On Tuesdays and Saturdays at 2330 UTC, Keplerian Elements for active amateur
satellites are sent on the regular teleprinter frequencies.
```

In a communications emergency, monitor W1AW for special bulletins as follows: voice on the hour, teleprinter at hr+15, and CW at hr+30.

W1AW is open to visitors during normal operating hours: from 1:00 P.M. until 1 A.M. on Mondays, 9 A.M. until 1 a.m. Tuesday through Friday, and from 3:30 P.M. to 1 A.M. on Saturdays and Sundays. FCC licensed amateurs may operate the station from 1 - 4 P.M. Monday through Friday. Be sure to bring your current FCC amateur license or a photocopy. Special arrangements must be made for weekend operation; please call or write at least a week in advance.

Headquarters and W1AW are closed on New Year's Day, President's Day, Good Friday, Memorial Day, Independence Day, Labor Day, Thanksgiving and the following Friday, and Christmas Day. On the first Thursday of September, Headquarters and W1AW will be closed during the afternoon.

>band you care to operate on. Every time I key up CW on 15 meters, the GFI
>in the bathroom trips :-(. Works fine on 80/40/10.

>Greg KD6KGW

Greg,

This may be easier said than done. In reality, the electrical wiring in
the house will be coupled into many nearby conductors -- plumbing,
other electrical wiring, telephone wiring, house siding, gutters, etc.
All of these will affect the resonant frequency of the wiring to
some extent or another.

I suggest that you destroy the resonance by installing a common-mode
choke at the GFI. These can be made from any #43 ferrite material,
using ferrite toroid cores at installation time, or split-bead
ferrite cores (about 15 are needed for 15-meter operation) to correct
post-installation problems.

All work done on your house electrical system must conform with local
code. Most local codes require that work be done by a licensed
electrician.

Additional information about electrical inteference is found in
the ARRL book "Radio Frequency Interference -- How to Find It
and Fix It."

>paying them anything." said program director Patrick Mellon from the company's
>Norfolk, VA., offices. "The essential issue is whether cable subscribers
>should have to pay for what non-cable subscribers receive for free."

Gee, that's strange. I was under the impression that cable subscribers WERE
paying for what non-cable subscribers receive for free. My cable company
certainly charges its subscribers for local stations. I thought the essential
issue was whether or not cable *operators* were going to have to pay to
redistribute someone else's material. Of course, the cable operators not
only have no intention of paying them anything, since that would eat into
profits until they pay the local city officials a sufficient bribe to allow
them a significantly larger rate increase than what the broadcast stations
want. They also have no intention of letting the public focus on THAT
aspect of this whole affair, either.

I think it extremely obvious that this has nothing to do with *amateur*
radio; please redirect followups somewhere appropriate.

>of 144, 220, 440, 900, and 1200. Hasn't got the gain of a beam
>but it "cheap" and simple.

About 2 or 3 months ago, QST had a do-it-yourself construction
article for a three element 2m beam, total cost of materials
was about $8 plus the cost of Coax. It used brass rod (or welding
rods) and PVC pipe.

Can't get much cheaper than that for a directional antenna.

Cheaper still as an omni-directional antenna is the ground plane
using an SO-239 connector and prass rod. Cost is about $5.

They both are right. Remember that as you increase in frequency,
the loss in cable increases.

>Cecil...KG7BK

Both numbers are correct Cecil. Loss increases with frequency, so
it's intuitively obvious that the higher frequency would show
greater loss. You can interpolate between those two numbers to
get an approximate loss at 440 MHz.

The Wellesley Amateur Radio Society and the Babson Wireless Club will operate Field Day from the lower athletic fields on the campus of Babson College in Wellesley, Mass. (former site of WBOS AM). We'll be operating 4A this year, primarily on 80/75m, 40m, and 20m both phone and CW. Depending on band openings, we may also be on 15m and 6m. We'll also have a 2m packet radio station going. Antennas will be various horizontal and vertical wire antennas and yagis for 20m and 6m. The power source will be the Wellesley Civil Defense 10 kW(?) generator. We'll also have a solar-powered QRP station active.

Local hams and non-hams are invited to stop by and see amateur radio in action and get on the air!

Jeffrey D. Angus wrote:

Recently sold FM Broadcast station KRTH in Los Angeles
ID's as K-Earth both by voice and on their billboard
ads. However, they do the "correct" ID as KRTH 101.1
MHz Los Angeles as required by the FCC.

Another Los Angeles example from a couple of years ago, was an FM sta-
tion which used the nickname "K-LITE", but at the top of every hour gave
its ID as "KEDG, Glendale". The station had recently undergone a change
of ownership, and within a few months I believe they had acquired new
call letters (KLIT, I think, or maybe KLTE) that were more in keeping
with their nifty monicker.

There's an "easy listening" FM station here in the Toronto area which
also calls itself "K-LITE". Every hour, though, they ID themselves as
"CKLH, Hamilton". Interestingly, it appears that Canadian stations are
only =required= to do an "official" ID once a day (often in the middle
of the night).

That's a point of view. I'm sure the cable companies view it as providing the broadcaster an oppurtunity to expand his audience to people who don't have access to decent antenna systems. Frankly, I don't think it's going to be the CATV who are going to suffer if they decide to drop broadcast stations rather than have these fees extorted from them. It's not the broadcast stations that are the money makers for them.

3900. Utah Balloon Flight.

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-21 16:21:45 UTC
From: alan@olin.es.com
Message-ID: <1993Jun21.162145.2457@dsd.es.com>
Source record: 280323

Some of you may be wondering what happened with the balloon which
was carrying a repeater and a beacon that was launched last
Saturday from southern Utah. As usual, Murphy struck. A sketchy
report from George, WI7E, stated that the beacon never worked,
and the repeater never worked correctly during the short flight.
The repeater was IDing, but the only time that a signal could
get through the repeater was during the ID sequence. Otherwise
it was silent. The balloon got lost somewhere over the LaSal
mountains - one of the balloons (there were three weather
balloons) broke and the remaining two balloons could not keep
the equipment aloft. Next time.

3901. Trade Wanted: Radio for Modem

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-21 16:33:11 UTC
From: donaldh@speedway.net
Message-ID: <204ns7$5c6@access1.speedway.net>
Source record: 280322
Cross-posted to: rec.radio.swap,rec.radio.amateur.misc,rec.radio.shortwave

I'd like to make the following trade:

A used Realistic DX-360 portable radio[AM:520-1620kHz, FM:88-108MHz, LW:150-265 kHz, SW1:4.5-5.5MHz, SW2:5.8-7.5MHz, SW3:8.2-10.0MHz, SW4:11.4-14.0MHz, SW5:14.6-18.2MHz, SW6:21.0-26.1MHz]. Has volume and tone control, tunning and low batter LEDs, earpiece plug, and runs off of 4-"AA" cell batteries or 6v adapter(not included).

For a standard external computer modem(standard meaning it uses the basic 25-pin to 25-pin connection).

So, if you've just upgraded to a new 20,000,000baud modem with ice-cube making attachment and would like to get rid of your old modem, then please drop me some mail. Would like to make this trade as-soon-as-possible. Thanks.

Donald

Just a small point here: The FCC no longer _catalogs_ the station
location information. They have purged their databases of it and
do not record the entry from the 610 form. Future editions of the
610 form will not include this item. For kicks, try asking your
local VE testing team if they are aware of this! I'll bet you'll
get any number of (wrong) answers. Look in the May copy of QST for
a small sidebar about this issue.

Another sign of the changing times....

3903. 6 meters: Frequently Asked Questions

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-21 17:00:39 UTC
From: randall@informix.com
Message-ID: <randall.740682039@moose>
Source record: 280195

I have been working on a 6m FAQ. Comments, corrections, etc.
are welcome.

THE SIX METER AMATEUR RADIO BAND
FREQUENTLY ASKED QUESTIONS
(Designed to help encourage hams to use and enjoy this band!)

WHAT IS THE SIX-METER BAND? The 6 meter band is a portion
of the RF spectrum allocated to amateur radio. The band
usually behaves like a VHF band similar to 2 meters. During one of
the rare F2 openings, propagation is more like an HF band such as
10 meters. The band is fun and fascinating because just about all
types of propagation pop up on 6m at one time or another.
The band is an acquired taste: a few hams work the band regularly,
but most hams never work it at all. Once you acquire the
taste, you tend to be hooked for life. The band has become
more popular in recent years with the help of greater
availability of better rigs. There two types of 6m operators:
the ones who use FM or packet for local work, and ones who
work DX with SSB. (Some like me even do both!)

WHAT ARE THE FREQUENCIES? In the U.S. and some other countries,
the six-meter amateur radio band lies between 50 and 54 MHz, just
below TV channel 2 in the U.S. In some other countries,
6m is allocated much less bandwidth. New Zealand's band starts
at 51.0. Check your allocations for your particular country.
They change pretty often as the band is becoming more popular.

WAS 6M ONCE TV CHANNEL ONE? Televisions in the U.S. start at
channel 2. Some ham books say that 6m was once channel 1.
This is not true. Just after WWII, Channel 1 in the U.S.
was allocated 44 to 50 MHz, with 6m occupying the same
spot as it does today. By 1948, interference from police
radios and hams made channel 1 nearly unusable. Early TV sets had
little or no RF sheilding. The ARRL recommended that channel
2 (54-60 MHz) be eliminated, but the FCC decided to axe channel
1 instead.

IS FM USED ON 6M? Yes, but not that often in most areas.
Most 6m enthusiasts use only SSB and sometimes CW.
The main FM simplex frequency is 52.525 MHz.
Your local range is better on 6m with the same power and a similar
antenna. If 2m is too crowded in your area, the FM portion
of 6m may be just the solution you need.

ARE REPEATERS USED? There are a few 6m repeaters listed in the ARRL Repeater Directory, but some of them are not operational. This will depend on your area. The offset in the U.S. is usually one MHz. (e.g. 53.330 out, 52.330 in)

HOW DO I KNOW IF THERE IS AN OPENING? Of course, the best way is to check for an opening is to listen to 6m, especially for the beacons that are listed in the ARRL Repeater Directory. Monitor 50.110 and 50.125 for SSB openings. You can also monitor 28.885 MHz, the "10 Meter VHF Liaison Frequency", where hams report VHF openings and schedule contacts. You'll hear some of those "pros" you see in QST like W5UN on that frequency.

WHAT ARE THE MOST POPULAR FREQUENCIES? Per the FCC, 50.0 to 50.1 is reserved for CW work in the U.S. Most operation is SSB. 50.100 is the most popular SSB DX frequency, and 50.100 to 50.124 should be used only for DX. Some hams tend to discourage (or flame) U.S. domestic stations from calling CQ in this "DX window". The other popular frequencies tend to vary from area to area, so the following is only a general guide for beginners: 50.125 is the U.S. domestic calling frequency, and most domestic SSB is found between 50.125 and 50.200. Only during hot F2 openings do you find SSB above 50.200.

DO I NEED A BEAM ANTENNA? If you want to work DX, yes. You can have fun with a vertical during openings, (I do with an Icom 726 in my car) but the pros use beams. Everyone is horizontally polarized, but cross-polarization doesn't matter for Es, F2, or Aurora. A few stations use 3-element beams, but a 4 or 5 element beam is so small that a LOT of people use them. Quite a few people have Cushcraft 6-element "Boomers". There are a few other big beams, and the lunatic fringe stacks them. For example, K6QXY has a stack of 4 six-meter beams, each with a 50ft (15m) boom. The higher the tower the better! I live in subdivision where no outdoor antennas are allowed, so I use a 2-element beam in the attic, and it works OK. I also use a vertical for local FM work. RG8 or RG213 is plenty good enough cable for most people. Antenna-mounted preamps are never needed.

IS 6M NOISY? External noise is fairly high at 50 MHz. It overrides the front-end noise figure on about all the rigs on the market today unless you have a LOT of cable loss or a VERY quiet location.

IS THERE PACKET WORK ON 6M? It depends on the area. Local packet work can be found in the higher frequency portions of the band. There has been very little DX packet work.

CAN I RUN RADIO-CONTROLLED EQUIPMENT USING 6M? This is legal in the U.S. for licensed hams. Check the ARRL Repeater Directory for suggested frequencies.

WHAT ARE "GRID SQUARES"? On VHF and up bands, the world has been divided in 1-degree lat x 2-degree long "squares" which start at the south pole and date line and "read right up". SSB stations will always identify their grid square along with their call sign, e.g. "KK6MY DM87". Each square is also divided into sub-squares. European stations like the subsquares; most US stations don't even know their own. In any case, the "squares" and their VUCC awards have been a wonderful interest builder, and have kept the QSL printers in business! Check the ARRL Operating Manual for a map of the grid squares.

WHAT RIGS ARE USED? Probably 50% of the active stations have 80 to 150 W output, either from old Icom 551D s (the 551 is 10W), or from solid-state (brick) amplifiers following the many types of 10W rigs, such as the Yaesu Ft-620B or the Kenwood TS-600. The Icom 575H is very popular, as it has an excellent receiver and 100 watts (the 575A is 10 watts). HF rigs that add 6m (such as the Icom 726) are usable but not as good as radios designed for 6m, especially in the receivers. Perhaps 40% of the stations run just 10 to 20 W, but most of them either get an amplifier or drop out after a year or so. The remaining 10% have tube rigs such as the Drake TR-6. Good 6m rigs tend to be expensive, even on the used market. Swan and Heathkit tube rigs are the least expensive and can be quite usable, but you will run into problems typical of older rigs, such as drift (especially on the Swan). The kilowatt is quite rare on 6m. The norm for serious stations is 100 to 150 watts.

CAN I USE A TRANSVERTER WITH AN HF RIG TO GET ON 6M? Yes, but you will either spend a lot of time tinkering with a soldering iron, or you will spend a lot of money on the high-end transverters from SSB Electronics. An SSB Electronics 6m transverter fully equipped will run you $800, but may outperform most of the VHF all-mode rigs. (or so SSB Electronics claims) Some hams build transverters, but you need a good level of electronics expertise.

I LISTEN TO 6M OCCASIONALLY, BUT I NEVER HEAR ANYONE. Openings on 6m are rare, especially during low points in the sunspot cycle. For hams in far northern latitudes (say 50 degrees and above), aurora openings are common. The most common openings in middle and southern latitudes are a result of sporatic E (Es), which occurs most often in June. F2 openings occur only when the solar flux is high. An explanation of the many types of propagation on 6m follows.

HOW OFTEN ARE THERE F2 OPENINGS? F2 propagation, the kind that we know and love on 20 meters, occurs rarely on 6m. Only at the peak times of the sunspot cycle, a few years out of each eleven, does the band open up for F2. When it does happen, the band becomes a frenzy of activity, and behaves similar to 10 meters. In the last cycle, there

were many openings in 1989 through 1991, but that cycle had
an unsually long period of peak activity. Openings occur
most often in Autumn during the daytime. A few stations
have worked 100 or more countries, but they have been patiently
working the fleeting openings for many years. The March, 1993
QST magazine has an excellent article on 6m propagation
that shows a correlation between solar flux and openings.

HOW IS TROPO PROPAGATION ON 6M? The ordinary ground-wave tropo
range on six isn't quite as great as on two. There are a
number of reasons. Since there are so many other propagation
modes on six, people don't try so hard on tropo. Antenna gain
often is higher on two. Noise is lower on two. At least in
the summer, stations like W3BWU (Pittsburgh), W3IDZ (northern NJ)
are easily worked from Maryland with the beam pointing at them,
and can be heard at almost any pointing. They are in the
150-W class.

HOW IS METEOR PROPAGATION? Any area workable by meteors
can be worked more easily by Es or aurora. Even though meteor bursts
are much strong and longer on six than on two, little use has been
made of them. There has been a VERY little meteor-burst
packet work on six. W3OTC had the first such contact (with
W0RPK). W3XO worked him a few years later.

WHAT ABOUT IONOSCATTER? Some people think it's really meteors, but
every weekend morning there are a number of nearly-
kilowatt stations working each other on SSB at distances
of about 600 - 1000 miles by ionosperic scatter. Sigs
are weak, and it takes good beams, height, and power, but
it is very reliable. See the old NBS papers by Bailey,
Bateman and Kirby, et al. Bateman and Kirby were/are
hams. Ross Bateman recently died. Dick Kirby continues
as head of ITU in Geneva.

HOW IS AURORA? It is much easier than on two. SSB is
usually intelligible. Point north about dusk, most
commonly in March and October/November. Lots of people
in the far northern latitudes work this mode when it happens.

WHAT ABOUT SPORATIC E (Es)? Es is the most common propagation
mode on 6m. The term "sporatic" is accurate: stations can pop
in and out and then fade quickly. I would monitor
50.110, 50.125, and 28.885 MHz to check for Es. Es has
little or nothing to do with the sunspot cycle; it is
much more a function of the time of year. Es is most common
in June, but can appear from May to August, and around
Christmas, here in northern latitudes. In addition to the
common single-hop range of 500 - 1500 miles, there are quite
a few double- and-more hop contacts on 6m. Now that a number of
Europeans are on six, we find that they can be worked
from the US east coast each summer. Likewise the

Caribbean stations work all over the US. The US west coast can work Hawaii, Alaska, and Mexico. You will also hear some hams on June DXPedition trips to Mexico and the Carribbean; they are easy to work in the late afternoon or early evening, even with 10W and a vertical. The VHF contest in the middle of June is also a good time to work Es.

WHAT ABOUT TRANSEQUATORIAL PROPAGATION? - The southern US gets a number of openings to South America by some kind of ionospherically-ducted propagation. The stations are generally about equidistant either side of the magnetic equator. Given exceptional luck, an Es opening linked into this mode can make it available to more northern stations. This mode has bad flutter fading and a touch of the auroral spectrum spreading. This mode also works sometimes on two meters if you use CW and really good gear. It has been worked on 432 MHz.

ANY MOONBOUNCE (EME)? - There have been a few EME contacts on six, but the required antenna size and high background noise makes it out of the reach of most people.

WHAT ABOUT TVI PROBLEMS? There is no doubt about it, six has TVI troubles. You don't find a lot of people on 6m in channel 2 areas unless cable is widely subscribed-to. VCRs are very prone to 6m pickup. Cordless phones, baby monitors, and kiddle walkie-talkies operate on 49 MHz. Most consumer electronic equipment has poor RFI shielding. The common connecting or power cable is a quarter-wave antenna for six. The TV owners have their revenge since the 13th harmonic of the color subcarrier, or something, of TV sets and TV games puts out a birdy at 50.113 MHz to bother the 6m operators in return. There is also quite a bit of trouble from noisy power distribution lines if they aren't buried (usually bad insulators or poor guy bonding).

Cecil A Moore (Cecil_A_Moore@ccm.hf.INTel.COM) wrote:
: >9913 has approximately 3db of loss per 100' at 330mhz.

: The ARRL Handbook says 2.3 db loss per 100' at 330 MHz and 3 db loss
: per 100' at 520 MHz. Which is correct? I just bought some for 440.
: Is 2.3 approximately 3 or is the Handbook wrong?
: Cecil...KG7BK

My Beldin catalog says 100 ft of 9913 has 1.8db loss at 200 MHz and
2.7 at 400 MHz. This seems to agree with the Handbook numbers.

David:

I've never seen a radio which will follow a network as you move
between station coverages... networks are not common here in general.

I've seen (but not heard) a Sony car stereo which uses two front ends
and two antennas to amke a space-diversity receiver for the FM
broadcast band (88-108MHz over here). I believe it uses a voting
receiver to pich whichever antenna has the highest SINAD (or
equivalent) at each instant. I've always wanted such a beast to get
rid of the picket fencing and the interference nulls that are common
in hilly terrain like the SF Bay Area. Dont'cha hate it when you're
stopped at a traffic signal and your antenna is right in the null of
the station that you're trying to hear?

A friend who had one of these beasts also claims that it has the best
car stereo tuner (sensitivity/selectivity) that he's seen.

3906. FD ARRL Section List

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-21 17:08:53 UTC
From: adams@chuck.dallas.sgi.com
Message-ID: <C8zEAt.Myp@odin.corp.sgi.com>
Source record: 280327

Gang,

for field day, every year, there are some who don't know the proper
abbreviations for the sections. here is a list (hopefully it is
accurate, but some typos may have slipped in and i know i will hear
about them ;-))

call area sections

1 CT EMA ME NH RI VT WMA
2 ENY NLI NNJ SNJ WNY
3 EPA DE MD WPA
4 AL GA KY NC NFL SC SFL TN VA PR VI
5 AR LA MS NM NTX STX WTX OK
6 EB LAX ORG SB SCV SDGO SF SJV SV PAC
7 AZ ID MT NV OR UT EWA WWA WY AK
8 MI OH WV
9 IL IN WI
0 CO IA KS MN MO NE ND SD
VE MAR QUE ONT MB SK AB BC

list made up from arrl section map in arrl operators handbook.
last SS i worked was before all the new sections!! so the clean sweep
list didn't help at all..... :-(

so gang, memorize it. of course, there will be some operators on
the other end that want repeats because you are using the correct
abbreviation and they didn't catch it and there will be unexpected
abbreviations received from them. keeps us all on our toes i guess.
check which section you're in before the games begin. field day
chairperson will probably already know this.

of course, with everybody keeping their old calls independent of
geographical location, a section doesn't always correspond with
the stations call area..... i won't get on the soapbox on this one. ;-)

notes: PAC is pacific for KH6s on the islands
AK is Alaska for KL7s in the north
PR is Puerto Rico
VI is Virgin Islands

hint: wanna increase your CW speed? work FD and SS. your code speed
will really go up in a hurry. get an Elmer and help them with logging
and dupping to start. requires earphones for both in most cases.

after this test you'll be copying morse from the shower, the fans, and lots
of background noise. ;-)

good luck in the TEST (Emergency Preparedness). watch out for the critters and Murphy. this is the largest gathering of radio amateurs to see who can destroy the most equipment..... :-) war stories to follow next week.

73 de NTX u b 599 hr om. dit dit
Dinasour Valley DX Society /5 QRP

flames to follow on the internet for typos, etc. :-) let the games begin.

Hi Scott,

We just picked up an IC-575H a week before the contest. I have ot agree, a FABULOUS receiver in it. We got it from AES from their USED shelf, for $999 (they sell new for $1380, I think), and it was in MINT condition. We used it for the contest, and maybe in the fall we will go rover with it (along with the 275A and 475H).

Prize goes to anyone who can identify the names of these sections. My
first field day I had a heck of a time finding these sections in CT
based on their spoken names (is it SCV? or SJV? or just SV?).

I'll bite (from memory, even):

EB = East Bay
LAX = Los Angeles
ORG = Orange
SB = Santa Barbara
SCV = Santa Clara Valley
SDGO = San Diego (Sandy Eggo ?)
SF = San Francisco
SJV = San Joaquin Valley
SV = Sacramento Valley
PAC = Pacific (not just KH6 -- also KH1, KH2, KH3, etc.)

Bonus Bonus: name the counties in each one.

73,

Jeff

Just received the news that John Broesder, WB2LHY became a Silent Key. John will be missed by all that had met him over the years. John was a past president of the Sussex County Amateur Radio Club in Newton, N.J. and was the editor of the club newsletter for the past 8 years. John always encouraged others to take their amateur radio license test to become a Ham. Thanks to his encouragement, both his two older brothers got their general license this past year.

I agree with this 100 percent. Start out in the Novice bands, then
work your way down in frequency. The high speed guys tend to gather
at the low ends of the CW bands.

Why do people pay to watch all those Soloflex and "Amazing Discoveries" infomercials? They alone prove that Cable TV has few redeeming values.

And now they tell us we can gave 150 channels! Wow!, we will move from 3 simultaneous Soloflex infomercials to 12 simultaneous Soloflex infomercials. Makes you want to tune to 14.313 for some intellectual stimulation.

Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.space

I am finally getting ready to setup my home satellite station. I have assembled a KLM 40CX and KLM 20C. I have a couple of questions that other users of these antennas may be able to help with.

1. The 20C polarity switching board is exposed to the weather. I'm concerned that the traces will eventually corrode. What is a good way to weatherize/seal the board?

2. The ends of the coax used for the baluns are exposed and water can get into the coax. What should be used to seal the ends of the balun coax?

3. I know this has been covered, so *briefly* what is the best way to weatherize coax connections to the antenna?

4. Any other hints or tips users can pass along.

3918. Re: Dipoles on Gutters

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-21 18:16:11 UTC
From: turner@safety.ICS.UCI.EDU
Message-ID: <9306211115.aa06111@Paris.ics.uci.edu>
Source record: 280188

In rec.radio.amateur.misc you write:

>In a recent discussion of wire antennas it was suggested that a dipole
>could be made using 5 conductor rotor control cable and cutting each
>conductor to tune for different bands and thus eliminate the need for
>an antenna tuner for these bands. I was wondering if anybody has done
>this and what would be the affect of running an antenna like this along
>the gutter of the house (125 ft long 14 ft above the ground).

Hi Bruce:

Just a quick opinion, from someone who has done what you say.....
It all depends. If your gutter has metal running along it, you may
experience detuning of the antenna. 14 feet off the ground is another
thing that may make tuning (cutting and trimming of the wires) tricky.
However, you just might get a good, working antenna this way. I have
had decent success with such an antenna at about 15 feet off the ground
with my Ten Tec Argonaut QRP 5 watt rig. I didn't get big signal reports
or work much DX, but when conditions were good, I did fine. Give it
a shot.

I would try to borrow someone's MFJ antenna analyzer or get
a noise bridge to do the adjustments. If you can't get one, cut the dipoles
for the CW portion of each band, then trim backwards towards resonance
(low SWR - not always resonance, but close enough!). Take your time here
and do it carefully, AND check each band for every adjustment to one
antenna....I would start with the longest element for 80 meters. If you
take care and do a good job, no antenna tuner needed, and plenty of
signal into the ether!

You are absolutely correct about what happened. You are also correct
about the DXers who didnt listen before transmitting over the nets etc...

However, the DX station in this case and others must share the blame for
the plain stupid operation. No DX operation should hog the band like that.
A well known and respected operator should like Romeo should set a much
better example. I wouldn't mind finally seeing credit for an operation like
this disallowed for DXCC. Yes, I know the hardships, expense, personal
dedication etc... necessary for such expeditions, but the line must be drawn
sometime.

: receiver to pich whichever antenna has the highest SINAD (or
: equivalent) at each instant.

My '87 Accura Legend has it. On FM, it automagically switches between
the motorized whip antenna and the rear-window "invisible" antenna.
(AM uses the whip antenna only.) I built a relay-switching
impedance-matching box so I can use the whip antenna on 144, 220,
and 440 MHz as well as AM and FM. It's kind of neat, since I can
still listen to FM (using the rear-window antenna) while using
the ham radio.

:

Ed, thanks for the information. You've identified the major problem here,
the need to do work best done at installation time *after* the walls are
all up and the XYL has her wall paper installed.

Since the 15 cores aren't likely to fit inside the outlet box behind the GFI
plug, are there any other options (say, decouple the signals by plugging
something into the outlet)?

My current solution is to stay off 15 meters, which so far hasn't been a great
limitation.

>younker@bcstec.ca.boeing.com |
Telling you to add a coaxial balun may improve your SWR but won't fix the real problem. Does the antenna resonate anywhere? You should be able to move these resonant points by adjusting lengths or adjusting the traps. The traps are adjustable. You have to use a heat gun. The traps have capacitors that are a single tube sliding in or out of another tube. some of them are double and slide like a trombone. Test measuring SWR at many different frequencies to determine the point where SWR is lowest. Make an adjustment, measure again. If you are going in the right direction keep going till you get it where you want. If you are going in the wrong direction go the other way.

I work CW. I don't know how it performs in the phone bands. I had to adjust the traps on all the WARC band traps. They sent me new traps twice before I tried adjusting. None of their traps satisfied me.

I use the R7 on a motor home when I travel. I carry it partially assembled. I have a hinged mount on the ladder on the back. I get on the roof, assemble and swing it up. It goes up in about 20minutes.
(Not bad for a gasping geezer!)

Ron Natalie (ron@topaz.bds.com) wrote:

: That's a point of view. I'm sure the cable companies view it as providing
: the broadcaster an oppurtunity to expand his audience to people who don't
: have access to decent antenna systems. Frankly, I don't think it's going
: to be the CATV who are going to suffer if they decide to drop broadcast
: stations rather than have these fees extorted from them. It's not the
: broadcast stations that are the money makers for them.

Does that mean the cable co's should not pay for anything that is not
scrambled or is in common key from the satellites? after all it is just
another antenna to pick up and rebroadcast the signal. And they are
providing the channels with a larger audience that would otherwise not
have access to the system.

3932. Motorola narrow band FM receiver & transmitter chips

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-21 20:21:43 UTC
From: David DiCarlo <r14793@waccvm.sps.mot.com>
Message-ID: <1993Jun21.202143.21123@newsgate.sps.mot.com>
Source record: 280174

Motorola makes narrow band FM receiver and transmitter chips for the cordless telephone market, but are usable up to 450 MHz. (MC3362/3363 dual conversion FM receiver, MC2831A tranmitter) The chips have built in varactor diodes and would readily lend themselves to very low power and very small synthesized FM ham transceiver applications with low parts count. The application notes which show some schematics for crystal controlled, free running oscillator and 10 and 265 channel synthesized applications.

My question is: have these chips been used in any construction articles where a pc board layout would have been provided? I don't subscribe to any ham publications at the moment, and have not for some time. Please post or email me any references you may have in regards to these chips

Thanks,
Dave DiCarlo

In my previous posting I listed the address of NZART Headquarters with a postal code. This seems to have caused a bit of confusion amoung a few people outside New Zealand, who were unaware that this country had taken on postal codes.

Sorry, I shouldn't have done that. The postal code will do you no good at all in sending a message. Postal codes have been in operation here for a number of years, but are only really effective when you are dealing directly with the postal company in the delivery of bulk mail.

The addition of postal codes has become a "habit" of mine. It does help sometimes, but not for inward overseas mail, which will be delivered with or without the code.

Sorry for the confusion (phew, thank goodness I got out of that mess...)

>Is 2.3 approximately 3 or is the Handbook wrong?

Well, probably both. The attenuation factor for coax increases with
frequency. The attenuation at 440MHz will be somewhere between these
two values.

Although the UK has a different licence structure to the US, it is interesting to note that we also have an ongoing debate (via packet radio) on the subject of standards..... While the UK exam questions are not published in advance (the examining body even tries to restrict their circulation by collecting *all* the exam papers back afterwards), being multiple choice (aka 'vote for Joe') does make them a lot easier than the old written exam which went out in the late 1970s. (Yes, I did do the 'easy' exam.)

I have never understood the American system of publishing the entire question pool in advance - or are there so many possible questions that you *can't* learn all the answers? I wish my University finals were published in advance - would have been a *lot* easier :-)

Bring back some technical requirement to amateur radio world-wide. We have the allocations because we are supposed to use them for self-training and (hopefully) some serious experimentation. If the various administrations around the world see amateur radio turning into a glorified CB then that might be all we get left with after the commercial concerns have swiped our bands.

Source record: 280215

I have posted this question before, but got a flood of info. Too much to make a good evaluation:

I would like to purchase a 2m handheld. I would like DTMF (repeater work), good power (5W?) and some features (memories, etc).

I would like to keep the cost below $250. I have seen nice radios around, but they usually have more features than I need.

Any advice?

>of 144, 220, 440, 900, and 1200. Hasn't got the gain of a beam
>but it "cheap" and simple.

I wouldn't call $50 cheap for something like that.... In fact, I'd
personally say that the above is a pretty expensive suggestion, especially
considering that the performance isn't likely to be very good at all.

I built a 2m beam (5 element ... I didn't have much room) for around $15,
and it only cost that much because the only places I had available to get
supplies from at the time were severely overpriced.

Besides, if you're going to go for something like a Radio Shaft scanner
antenna, why not just make a simple vertical or hang a dipole vertically?
After all, everyone here knows how to make a simple dipole, and they're
REALLY cheap...and either one would probably out-perform the Radio Shaft
antenna by a pretty significant amount.

What you want to do is get a copy of ``The ARRL Antenna Book'' (you should
have a copy of this most valuable book ... if you don't, drop everything
right now and go buy it!). In this book, you will find all sorts of
antennas designs, including yagis, quads, quagis, verticals, J-poles, and
just about anything else you can imagine.

If I remember correctly, the designs for the beams use lengths in terms of
wavelengths, and not as absolute values, so you'll need to understand how
to convert to/from this, but then, if you've got your license, you already
have a good, solid understanding of how to do this (or else you would have
failed the test). And even if it's been a long, long time, and you've
forgotten, the Antenna Book has a section that will remind you. :-)

Also, when looking for the Antenna Book, if you happen to find a copy of an
older issue (particularly the one from around 1981, with the blue cover),
grab it fast! From what I've seen between my old issue and my newer one
(ca. 1992), even though the new one is a lot thicker, it seems to leave out
a lot of the details and theory that the older issues had. I still go to
my old copy far more often than the new one when looking for ideas.

Suggestions for (cheap) materials:

*) boom: thick (e.g., 3/4 inch or 1 inch) wooden dowel from your
local hardware store (building supply stores are often cheaper)

*) elements: whatever you can get that's around the right length...
You should be able to find stainless steel rods in more or less the
same spot in the store where you found the wooden dowels. If you
ask nicely, they'll probably cut them to length for you for free.

If you're thinking about a quad or quagi, I'd get some moderately thin
copper tubing (this *ISN'T* as cheap, but it shouldn't be too bad). I
say moderately thin, because the thicker copper tubing is a b*tch to
solder with a normal low-wattage iron (all I have is a tiny 15 watt iron
that's meant for working with fairly dense printed circuits). If you've
got the right size iron (or torch/whatever), you might want to go for
heavier tubing, both for a more broadbanded antenna and for stability.

I was looking for something with a relatively fast setup/teardown time, so
I used alligator clips to connect the coax to the driven element. Not a
great solution, and certainly not one I'd use on anything except an antenna
that was meant to be ripped apart and made portable, but it turned out to
work rather nicely (relatively speaking, of course).

Ray Furlong, W6QIL passed away 6/18/93. His wife found him slumped over in his easy chair.

Many remember Ray from his many years of support as a friend and an Elmer. He was 71 years old, but looked only 50 just a month ago. Ray had many activities and capabilities. To list a few that I know;
1. Lived in Long Beach
2. Taught electronics part time at El Camino College
3. Was in the Navy during WWII as a radio operator
4. Was a trustee of W6RO, the Queen Mary ham station
5. Could remember the call letters of every person that he met over his many years as a ham
6. Could send and receive CW at 65 WPM. Plus being able to write notes and carry on a conversation to the person next to him

I had known Ray since 1946 when we were members of the Inglewood Amateur Radio Club. At that time, we worked many field days together. What a pleasure it was to know him.

In addition to the above, he was a nice guy!

>up-to-date elements from?

That's right, treat the shuttle as a satellite and use a satellite predition program with NASA 2-line elements or AMSAT format elements.

Shuttle elements are posted regularly during flights in sci.space.news, rec.radio.info and rec.radio.amateur.misc. Look for articles where the subject starts with "STS-57 Element Set". Depending on how fast you get your USENET news, faster service is available thru an email subscription to the shuttle elements mailing list. For info on that mailing list send a message to "listserv@alsys.com", to subscribe send a message containing your Internet mailing address to "elements-request@alsys.com". This is the best source for Shuttle elements, but I'm biased, I run the list :-)

Fred McKenzie (fred-mckenzie@ksc.nasa.gov) wrote:

: Now, what about the response of a diode string to a fast rise time
: transient voltage? The voltage spike will divide among the diodes in
: inverse proportion to their reverse bias junction capacitance. The more I
: think about this, the less sure I am about what the end result would be.
: Would the resulting current exceed some instantaneous reverse current or
: power limit? Or, would the sum-of-zener-voltages analysis still apply? My
: "feeling" is that use of parallel capacitors to swamp out the junction
: capacitance, would make the circuit more reliable. Of course, these
: capacitors' voltage ratings still must be taken into account.

Actually, we can avoid this whole discussion of transients by using LC filters and MOVs. :-)

To analyze the situation, I think you want to work out the voltages across the diodes wrt their capacity. If the highest voltage exceeds the PIV, then subtract the PIV from the transient, short the diode, add PIV*Iz to its power dissipation, and rework the network again.

What is Iz? q = cv = it. Note that putting capacitors in parallel with diodes is a bad thing if one of the capacitors should open.

Let's assume failure is caused by localized junction overheating, rather than arcing. I don't know much about the junction thermal resistance, but Ifs (surge) for the 1N4007 is typically 20 amps for 1/120th second. That's an instantaneous dissipation of 20*.7 = 14 watts (wow!). Working backwards, this is a margin of 14W/1000V = 14 milliamps.

I think the game here is to keep the average dissipation under .7 watts. Additional zener current must be offset by lower forward conduction.

> >31.7 mW, or 39.8mV in a 50-ohm system. However, if this is true, why is
> ^^^^^^^^^^^^^^^^^^^^^^^^

Yes. That should read "...+15dBm. That's only 1.2 volts RMS in a
50 ohm system..."

After I complete a few tests tonight, I'll post a revised version. I
found a Good Guy at OE this morning and he pointed out a few things.
In the interum, note the above and the following:

The 1-200MHz input in their sales lit is non-existent. It's a typo.

The second to last paragraph gets bogged down in dBm, dB, dBmv, etc.
The critical numbers are: Sensitivity -57dBm to -11dBm, input limited
to +15dBm. This makes a *lot* more sense.
The 3GHz input is spec'd at -11dBm. Mine at 2GHz is -43dBm (much
better). Spot checks of each 50-ohm amp show they match or exceed
specs at each frequency checked.

THANK YOU for the feedback. I miss the capability for peer review
I used to have back in the academic world. When it's only me and my
electronic bench, I go bug-eyed after the third proof read.

The original call for KCBS-TV in Los Angeles was KNXT, the television license associated with KNX radio. KNX is a CBS station, and a few years ago thay went after better network recognition for their west coast flagship, so they applied for a call sign change to KCBS. There is also a KCBS-FM radio affiliate playing "oldies" in the L.A. metro area. I don't know how many broadcast locations can be serviced by a single license, but it looks like the answer is greater than one. :-). How 'bout it Gary, how many KCBS's could Columbia Brodacasting operate at one time?

Hello,
I am on my way to Southern California and am interested in
Catalina 2m or 440Mhz repeaters. If you know any other repeaters that can
work from Laguna Beach out to L.A. are that would do too.

Thanks,
Dan

3955. Interference on 137mhz band from tv station

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-22 00:54:02 UTC
From: smace@nyx.cs.du.edu
Message-ID: <1993Jun22.005402.25685@mnemosyne.cs.du.edu>
Source record: 280221

I am experience some weird reception in the 137 mhz weather sat
band. At 136.5mhz I can clearly hear the audio carrier of TV channel
67. At 137.71mhz I hear a sort of intermittant beacon with the tv 67
audio in the background. Whenever recieving sat imagery, I get these
intermittant losses of data which correspond to the times when the
beacon is active on 137.71mhz.
1. Is this the result of intermodulation interference in my recievers
front end.
2. Are these just harmonics.
3. How to I solve this prob, resonant cavities?, filters?

The tv station is at 793.75 I think. I not positive that the beacon
is actually tranmitting on 137.71 either.
This is NOT caused by computer RFI.

Also this all started with the addition of a 20db GaAs-FET pre-amp.
There is a CATV line that runs along my fence line about 50ft away from
the antenna. It is not feasable to move my antenna any further away.

Thanks,
Scott Mace

I just got my Belden catalog in the mail, and I've got a question: For some of the cables, they only list the capacitance of the cable per foot, meter, or whatever. Now, in my EE courses here at Virginia Tech, we dabbled in the capacitance's role in losses, so I know the less the better, but I can't seem to recall a specific formula for loss at a frequency for a given capacitance per length. Could someone post or mail a formula if one exists?

When I was at Southern Tech in Marietta, GA, I had a show at their college station... I was required to ID basically once an hour somewhere around the hour....
My ID would consist of "This is WGHR, 102.5 FM, Marietta, GA...the voice of Southern Tech.

Sometimes if I wanted to get really cool, I'd say something to the effect of "From the top of the Admin Building, with a cool 10 million Microwatts, this is WGHR, 102.5 FM - Marietta - The Voice of SOUTHERN TECH."

I hope I got the SI unit conversion right...10 million uW = 10w, right?

We were actually 16w ERP...had a 4 bay B&W circular pole array...and we were the ONLY station on the FM band in Metro Atlanta that still was in MONO!!!!

There have been some changes in the Mac's sound archeticture in recent models.
I have the same problem with my IIvx. Some software will work, others won't.
It depends on how well the programmer stuck to apple's specs. Anyway, there is
a great Freeware program called MorseTrainer US. Here's an excerpt from a
recent mailing describing it:

"MorseTrainer US-1.0.1b20
MorseTrainer is a powerful tool for learning and training Morse code. This
is the first translated version of the program which originally was developed
and localized for Sweden. The program itself can be considered a final
version of v1.0.1 but the translation is probably not perfect, hence a
beta-release instead of final-release.
Features: three different training modes: user text, random text, library
text; arbitrary signal pitch and timbre; arbitrary speed and tempo;
multi-alphabet support; random text generator, text library editor; on-line
alphabet; on-line manual; Help Balloons; and a lot more! FREEWARE!
MorseTrainer will soon be available on a number of different archives such
as sumex-aim.stanford.edu and all its shadow-copies. A swedish version
(S-1.0.1) is available via anonymous ftp using the address 130.235.20.3 in
the mac/swedish/ directory."

I think the US version is also availabe at 130.235.20.3, but I am not sure if
that's the address I got it from. Anyway, it works great on my vx.

Well, let's see, where would a satellite be that orbited the earth
at the same orbit as the moon. Hmm, it'd be ON/IN the moon. Gee, we
might as well go there.

>Now, if someone had a super power telescope, maybe they could see the flag
>we left there (if it is still standing).
>
Funny you mentioned that. When I was younger, I wanted a telescope
just for that reason. I've been meaning to do the math to see if anything
could see any sign of the Apollo landings on the moon, like the LEM base,
which would be the largest thing (perhaps one of the SV-III stages that
was crashed as I recall?)
As I recall, they can't be seen from earth.

Once on a talk show I saw a guy who doubted the moon landings.
He asked why we didn't bother bringing a couple hundred pounds of a
dark powder, like graphite, and spread it in a pattern (like the letters
NASA or US I suppose) on the moon. Even at that young age (I think I
was 12 or so (but my gf says I seem to ahve done everything at 12)) I
could come up with a half dozen reasons not to. But, thanks to Henry's
point about the albedo, I'm even more convinced it was a stupid idea.

>Chuck Harris - WA3UQV

Sorry, guys, for the confusion. I had a misplaced modifier. What I really meant to ask was, "Which is correct, 2.3 db loss at 330 MHz or 3 db loss at 330 MHz?" As it turns out, the ARRL handbook is correct and the loss at 330 MHz is closer to 2 db than to 3 db.

From: LEY@UWSTOUT.EDU
Message-ID: <01GZNO7EBAE8002EPC@UWSTOUT.EDU>
Source record: 280132

>Cable subscribers are *already* paying for what others receive for
>free. It's in the basic cable charge. The only question is whether
>local broadcasters should get a cut just like the non-broadcast and
>"superstation" originators do. Right now the cable companies have a
>free ride on the programming costs absorbed by the broadcaster while
>"pirating" away his broadcast audience and charging *them* for it.

Broadcasters get their profits by charging advertisers for their air-time.
Why should he care if the viewer gets him directly off-air or if he gets
it by plugging in a cable? As long as the viewer is counted by the Neilsens
or whoever counts viewers the broadcaster is going to get the same money.

If a viewer doesn't want to pay the cable company for a local station he
just has to buy an antenna. The viewer/cable customer pays the cable co.
to get the convenience of not having to worry about lighting on a tower or
rotating an antenna or to get the better signal from the top of a tall tower.
He also is paying to get the extra service of all the other "cable" channels
like USA, Discovery, A&E, etc. This includes WTBS and WGN for the people
outside of the local listening area.

SB SAREX @ AMSAT $STS-57.004
STS-57 Post Launch Keps

The Space Shuttle Endeavour made a picture perfect launch at
Kennedy Space Center today. Launch occurred on June 21 at
13:07 UTC. SAREX operations are expected to begin
approximately 20-24 hours into the flight. Enclosed is a copy
of Keplerian elements, generated by Gil Carman, WA5NOM. This
element set has been modified from the current set to include
the orbit adjust burn scheduled at 22:28 MET. Thus, this set
will be good for SAREX operations between MET 22:28 and the
next burn which occurs at 1/4:42.

|> > 73, Tom WI3P collinst@esvax.dnet.dupont.com or collinst@holonet.net> ***** The comments,
|>
|> You are absolutely correct about what happened. You are also correct
|> about the DXers who didnt listen before transmitting over the nets etc...
|>
|> However, the DX station in this case and others must share the blame for
|> the plain stupid operation. No DX operation should hog the band like that.
|> A well known and respected operator should like Romeo should set a much
|> better example. I wouldn't mind finally seeing credit for an operation like
|> this disallowed for DXCC. Yes, I know the hardships, expense, personal
|> dedication etc... necessary for such expeditions, but the line must be drawn
|> sometime.
|>
|> Bob KD1GG
|>
Do you think it would be much better to say "...listen 5-10 up.." ? Really?
Looks like never heard a fine pile-up...
100khc are too much but working in such a dxpedition only 5 khc split width
would be stupid.

3968. HAM-server index of files

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-22 06:59:34 UTC
From: HAMSinfo@GRAFex.Cupertino.CA.US
Message-ID: <gate.Z02i6B1w165w@GRAFex.Cupertino.CA.US>
Source record: 280142
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.packet,sbay.hams

HAM-server@GRAFex.Cupertino.CA.US

Index of files.

NOTES: ----------

If you order a file and do not get it, check the index to be sure you have spelled the filename correctly. If you have ordered the file correctly, then order a new INDEX, as I may have moved the file to a different directory. The system is still expanding, and I am trying to keep it in managable chunks.

Also, if you have ordered files from HAM-server and do not receive them, it might be because your return path is incorrect. My bounce mailbox fills up quite regularly with bounce messages. And, since the path is incorrect, I cannot contact you to let you know.

Orders must be sent to HAM-server. Orders sent to KA6ETB or HAMSinfo are ignored.

A new INDEX is automatically generated every Sunday and when files are moved or added.

/hamradio/newfiles/ contains files that have not yet been categorized. You can order a list of newfiles by sending the following in an email.

NEWFILES <date>

<date> is in the form of MM-DD-YY, and is required.

The archives may contain the same file under different names. If you should run across one of these, please let me know with email to KA6ETB@GRAFex.Cupertino.CA.US

: or whoever counts viewers the broadcaster is going to get the same money.

It is sad but true, the cable channels also run commercials, I hate the topsy tail. The broadcast stations add value to the cable company, therefore they should get some money for the service they provide. that arguement is like saying that since the theatres make lots of money selling milkduds and ju-ju fruits and the studios make lots of money by endorsing products therefore we should get into movies for free. What if you created a nifty windows program in your spare time and suddenly Microsoft started including it as part of the Windows 6.7 bundle. Hey you had already developed it and had a job to pay your bills during development, why do you want to get paid for it?

obviously it is a reference to the fact that you need an especially tall
garage to allow your antenna to fit inside. It also helps to build the
garage roof of RF transparent material to provide better reception for
your attic mounted antennas. :-)

^^^^^^^^^^^^^^^ ^^^^^
YES YES

>Looks like never heard a fine pile-up...

I'm not sure what your point is here, but if you mean I have never heard such a 'fine pile-up'. Wrong. If you want 100KHz of bandwidth at least go to 10 meters. And why not just do CW, the QSOs are faster and he probably would only take 10-15KHz.

>100khc are too much but working in such a dxpedition only 5 khc split width
>would be stupid.

So Thomas what is the alternative? Wiping out about 50% of the 20 meter voice band and interfering with 'ON GOING' QSOs? I don't think so.

>Above the PVC pipe...I know PVC is a Bad Thing at HF, but what about VHF?
>Can you really get good results with it there? Or would a wooden dowel
>(see my post from yesterday on this) be a better thing to use?
>
I remember the April 1977 Hink and Kink by W1CKK showing a piece of
melted PVC tubing that was used to support a vertical loading coil.
It said that nylon and PVC are "extremely lossy".

But, is this really accurate? It has been pointed out that the
mere fact that the stuff melts is *not* an indication that
the PVC is causing high losses. Fact is, it doesn't take a whole
lot of energy to melt PVC. On the other hand, melting a ceramic
coil form doesn't happen all that often, even though I've seen
a tuner that would make a nice space heater before the solder
melted...

Keep in mind that losses in loaded HF verticals can be quite
high, regardless of what material is used for the coil form.
The PVC may melt even if it contributed no additional losses,
simply because it is surrounded by hot wire. Anyone actually
measure the additional losses caused by PVC?

Page 23-39 of the ARRL Handbook shows a helical antenna wound on
2 1/2 inch (2.875 actual) PVC for 1269 MHz. Is it cost effective?
Probably. Would it smoke if you ran 1500 watts into it? I wouldn't
be surprised.

Thanks, Julian, I was just curious. I thought that in California they would be required to recycle 100% of the water, or that there was some environmental legislation requiring glass-bead blasting to be used in future in the pipeline. Low tech manual (manuel?) labour doesn't fit the high-tech image.

For those who do wash their cars at home, under the area used is a superb place for ground (earth) rods.

Cheers
David

3974. 6 Meter Telephone RFI

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-22 10:53:56 UTC
From: seeler@UPEI.CA
Message-ID: <seeler.18.740746436@UPEI.CA>
Source record: 280147

I have a quick question about 6 Meter interference to a telephone. I have the ARRL handbook and RFI book as well as the info from the server and I am slowly going through that information. I hope that the problem can be solved with the info that is there.

Situation:

Sun eve - was on 6 working Michigan stations when my neighbour came over and said that I was audible in two of their phones (they have 7 - hopefully not bad news). I stopped operating and went to the books. I have a game plan in mind as per the ARRL recommendations but have one primary question:

Has anyone found any particular filter or solution particularly helpful for 6 meter or VHF RFI ? Suggestions are welcome.

I would like to solve it as openings have been rare on PEI this year and I suspect that I am not the only one that would like to chat on 6 to/from PEI :-) .

I am also getting into their FM baby monitor (it operates at 49.99 Mhz) but I am less hopeul of solving that one due to its probable WIDE Front end - but will try.

My ground is about 3 meters from the rig (as close as I can get), on the same side of my house as the neighbour. Would a 1/4 wave counterpoise on the rig help?

Please direct comments to Seeler@UPEI.ca - as I will be on vacation for the next 3 weeks. Hope it is time spent operating - not fixing.

73 and thanks..... Dave

3975. 6 meter and telephone RFI

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-22 10:59:17 UTC
From: seeler@UPEI.CA
Message-ID: <seeler.19.740746757@UPEI.CA>
Source record: 280148

RE: 6 meter Telephone RFI:

Forgot to mention -

Station is in the basement, NO INTERFERENCE to my phones, televisions or any other device in MY house. I have an appropriate low pass filter within 2 inches of the rig and I use ground braid from as copper bus (pipe) in the station to the 8 foot ground rod -. There is some harmonuic (2nd) radiation from the ground rod (as measured by a sony walkman - audible for 20 feet from the rod).

Thanks Dave

3976. How do you view a TAR file? .... The Answer

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-22 12:15:40 UTC
From: skitch@nadc.navy.mil
Message-ID: <9306221215.AA14003@NADC.NADC.NAVY.MIL>
Source record: 280150

First I would like to thank everyone that responded
to my request for information about viewing a TAR
file. I would have responded to each of you
personally but I accidentally deleted the file with all
the posts about TAR files.

Here is a summary of what I learned.
The file CHUrcvr.tar.Z is available for anonymous
FTP from UCSD.EDU and is in sub directory
hamradio.

The .Z extension is a UNIX compressed file and to
uncompressed it just use the command;

uncompress CHUrcvr.tar.Z

I used kermit to get the CHUrcvr.tar file from my
UNIX account to my DOS computer.

Next I used the following command in DOS;

tar -fxv CHUrcvr.tar

The tar.exe program is available from
oak.oakland.edu via anonymous ftp in subdirectory
/pub/msdos/filutl.

Once again I would like to thank everyone.

Again last night spotty 2 meter Es from MD/Va to Mid West, Mo area.This was 6/21/93 at just before 9 PM local. Approx 5 stations weak burst through in mostly separate grids. Grids available on home records. Will start including 93 E-Skip data base with report soon.

Also last night on 6 Meters, Midwest and Utah were in to Mid Atlantic area. VE3 beacon in for short time along with rpts of CT3 (listen on 28.885) into GA and Washington State.

Also late report of 2 E during this years VHF contest. On Sat. at 1910Z W3ZZ rpts. Kansas and Mo (W0JRP) came in quick and out! This was 6/12/93. Dick

3978. Re: Poor Operating Practice By 5A0RR

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-22 12:34:53 UTC
From: ham@wam.umd.edu
Message-ID: <206u9d$30l@cville-srv.wam.umd.edu>
Source record: 280152

I'm not saying that it was bad operating practice to use 100 kHz. Ideally, for a station like a 5A, whom nearly everyone needs for DXCC, one would like to spread out the people calling as much as possible, to reduce interference as well as give everyone a chance at a clear frequency.

On 10 meters, if Romeo were listening from 28.600-28.800, nobody would complain because the band is very expansive - 200 kHz isn't that much.

However, on 20 meters, 14.200-14.300 is 100 kHz, right in the middle of a 200kHz wide band! A band that's used for countless traffic handling nets, DX nets, and a million other uses. It's the general purpose ham band!

Still there would be no problem, if the world were perfect, and if a clear frequency REALLY were a clear frequency on BOTH ends of the QSO. If I'm in a QSO with a European station, and I'm talking when somebody calls a couple of brief QRL's, due to the proximity I may not be heard, and the guy in Europe won't really hear the QRL as he's not really listening for it. So the other American station starts using the frequency.

Normally, this person would LISTEN on the Xmit frequency. However, in split operation, this third person isn't listening when my friend in Europe tells him that he's causing all kinds of QRM, and to please move. Using 100 kHz of the 20 meter band is STUPID because this kind of unavoidable effect happens a LOT, and on the busiest band there is.

Basically, Romeo used 100 kHz to make it easier for everyone to contact HIM. Unfortunately, this was not the goal of everyone sitting between 14.200 and 14.300 MHz, and it was incorrect of him to think that every-one would use the band responsibly.

3980. Midland Power-Max Dual Band Antenna

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-22 13:20:04 UTC
From: hgpeach@ms.uky.edu
Message-ID: <C90yDI.HxJ@ms.uky.edu>
Source record: 280167

I recently finished installing a Midland Power-Max dual band antenna. (This antenna looks like a cellular antenna, is coupled through the glass, but operates on 2m/70cm.)

The problem is that even with the antenna mounted in a manner far exceeding the installation instruction's specifications, it still has an SWR of 4:1! There are no adjustments possible and according to the directions, trimming/adjusting the antenna length will have little effect upon the SWR.

Anyone else been down this path? Any suggestions?

>
> Gary

Gee, last time I checked, Broadcasters made their money from *ADVERTISING*.
The ammount that advertisers pay is based on *AUDIENCE*. Audience is calculated
from the number of homes in the viewing area. The viewing area is extended by
fringe cable systems acting as an 'antenna' for the broadcast signal. Thus
increasing the number of viewers on which the advertising rate is based.

Therefore, with cable coverage, the number of viewers is increased, the
advertising rate increases and the Broadcasters profit increases.

The broadcasters wanted their cake and to eat it too. They wanted what they
had (must carry), and for the cable companies to pay for the privilege. The
FCC came up with a very equitable rule - take your choice 'must carry' or
$$$ but not both. My personal opinion is that if my cable company dropped
broadcast signals, I wouldn't cry a drop (except maybe during Football season,
if the Bears are having a good year).

As far as the broadcasters should be concerned, the cable company acts as a
replacement antenna for the subscriber. Nothing more. If the Broadcaster can't
compete with the other programming available, then maybe they should improve
their programming.

(Sorry Gary - I'm on the other side of the fence from ya on this one).

On the other hand - it's mostly because of Cable Television, that "no antennas"
is becoming common in new housing developments. At least before cable, you
didn't have nearly the trouble putting up a tower in the Suburbs. Most of your
neighbors had one too, with a TV antenna on it and a rotator.

Ya can't win..

3988. Re: KCBS (was Re: Broadcast IDs)

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-22 14:36:37 UTC
From: richw@mks.com
Message-ID: <1993Jun22.143637.21556@mks.com>
Source record: 280165

The CBS TV station in Los Angeles (ch. 2) did indeed change its call from KNXT to KCBS-TV a few years back. There was no KCBS-TV before that time; the CBS network affiliate in San Francisco was, and still is, KPIX (ch. 5). For that matter, I don't believe KPIX is actually =owned= by CBS; my recollection is that it's owned by Westinghouse (or some entity called "Group W", which I believe is a subsidiary of Westinghouse).

So, now, the three major networks' TV stations in L.A. are KCBS-TV (ch. 2), KNBC-TV (ch. 4), and KABC-TV (ch. 7).

As for the AM stations -- the last I knew, the CBS AM radio station in Los Angeles was still called KNX, and the CBS AM station in San Francisco was still called KCBS. Both stations carry primarily news and have been widely known for decades in their respective coverage areas. If CBS is planning to swap AM calls too, I haven't heard anything about it (and, for what little my opinion is worth, I think it would be a massively stupid and pointless idea).

My basis for knowing the above is that I grew up in the San Francisco area, then lived in Los Angeles for about 15 years before moving to southern Ontario.

I'm afraid I've lost track of the FM situation. I know there was a KNX-FM once (in Los Angeles), but it went through several changes in format and call letters and I don't know what its status is now. I think there was also a KCBS-FM in San Francisco, but I may be wrong. Maybe people in L.A. and/or the Bay Area can fill us in on the current state of affairs.

>The earth will provide a good ground as long as some moisture is available -
>but given time, the earth under your house will be pretty dry. You
>certainly want a short run to the ground rod, but put it outside of the
>house. Preferably, in virgin earth outside of the roof's "drip line", where
>rain can get to the soil. A heavy braided cable will provide a good signal
>ground. Bond the signal ground (per the National Electrical Code) to the
>main electrical ground.

A Code minimum 8 foot rod will reach earth with the same moisture conditions whether it's under the house or beside it. Rain runoff only affects the first foot of soil in most cases. The earth has to be viewed as a sheet resistance, and the more surface engaged by the grounding conductor, the lower the resulting ground connection resistance.

The key to effective grounding is to make contact with as much earth as possible. One of the best ground systems is called the "Ufer" technique after an engineer named Ufer who developed it for the US Army in WWII. The Army needed an effective ground system to protect bomb storage vaults from static and lightning strikes. Mr. Ufer found that a minimum #4 gauge copper wire embedded in a concrete footing or floor gives an effective ground even in dry soil conditions. A 20 foot length of such wire will give a 5 ohm ground connection in soil with a resistance of 1,000 ohms per meter. Rebar works about as well as copper for this purpose, and a mesh mat will work too. The more metal embedded in the concrete, and the larger the square footage of the concrete in contact with soil, the lower the resistance of the resulting ground. The grounding conductors should be embedded a minimum of 3 inches into the concrete for best results. Note that conductors embedded in concrete corrode much less rapidly than those in soil, so your ground will maintain it's characteristics for many more years if done this way.

Concrete never really "dries". Even old concrete maintains a high moisture content and has a pH of greater than 7 which means ions are available for conduction. This makes it a conductor better than "dry" soil. To reduce the sheet resistance of the earth connection, large contact areas are required. By embedding conductors in concrete, better results are obtained than with a few driven rods because much

more conducting area is in intimate contact with the soil.

Ome inch rebar can safely carry 8150 amp surges and 1/2 inch rebar can carry 4500 amps for each foot of embedded rebar in a Ufer grounding system. Since most lightning strikes don't exceed 18,000 amps surge, a few lengths of rebar are sufficient to carry the current without danger of the concrete "exploding". However, for equipment protection, and effective RF grounding, much more than the minimum lengths of Ufer conductor should be used. I'd shoot for a ground resistance under one ohm, and that would require at least 100 feet of Ufer conductor embedded in footers or concrete flooring.

The Ufer ground is a Code approved alternative to driven rods for "made" grounds. And it's much more effective for RF than a Code approved ground rod alone. That's because most RF coupling to Earth is via capacitance, and the Ufer's greater area results in more capacitance than can be easily obtained with driven rods.

FCC used to keep the exams in US. Then some enterprising guy (I forget
his name) decided to question the candidates as they came out of the
FCC office after taking a test. Pretty soon, you could buy books that
had the bulk of the questions that showed up in the exams.

Add to this the system of Volunteer Examiner system. Under this system,
a team of three volunteers, accredited with a national body such as the
ARRL, administer the exam. Some get the questions from the national body
while some, like my team, make the exams themselves. How do you
guarantee the quality of the exams?

>Bring back some technical requirement to amateur radio world-wide. We have

Hams on the internet do not represent an average cross section of hams.
Many of us are in educational institutions or in technical vocations.
We find the theory parts easy. There are others, many not on the
network, who find the theory significantly more difficult than CW.
I know some one, a retired carpenter, who has passed the Extra CW
test many times and has never been able to pass the theory test.
I have heard him on the air and he is an excellent operator. I
would much rather have him handling traffic during an emergency than
many other much more technically inclined people that I know.
Having a killer theory test may keep such people out.

>something into the outlet)?

Now we know why they don't make me an editor here -- I am not always
100% lucid in my write. (Neither are some editors, but saying that
to my peers here would be inflammatory . . . :-)).

For typical wiring, *one or two* FT-240-43 *toroids* will usually do the
trick. It actually might be possible to fit this into the wall
space near a GFI outlet, or at the circuit-breaker panel before a
GFI breaker. The usual difficulty is that there is not enough slack
wire to get several turns onto the core.

That is why I recommended the split-bead ferrites. They will fit over
the existing wire. The real difficulty is that you need so darn
many of them. You need about the same number as you would need
for a choke balun on an HF antenna (ARRL Antenna Book).

There are two problems with the decoupling approach. First, most
of the time the interference picked up on house AC wiring is
common-mode, meaning that it is picked up by all three wires (hot,
neutral and ground) in phase -- the wires act as if they were one
wire. Most AC-line filters do a good job filtering the two wires
(hot and neutral), at least in the differential mode (the signal
on the two wires are opposite in phase). However, they almost
always don't filter the common-mode signal, and they almost never
filter the ground. I have no real idea if the GFI is responding
to the common-mode signal, or what smaller amount of differential-
mode RF signal is being picked up by the house wiring.

Unfortunately, anything plugged into the outlet is being installed
after the fact -- the RF signal has already gotten to the GFI
circuitry and worked its deviltry. If, as is likely the case, the
signal is common-mode, even an AC-rated capacitor such as that found
in many AC-line EMI filters, across the hot and neutral may not be
effective. It is, however, something you could have your electrician try,
if local code permits. Please remind the electrician that ONLY filter
containing AC-rated capacitors should be installed across
AC power lines! Anything else would represent a real fire hazard!
When you consider that heat is indeed electromagntic energy, you don't
want to trade your EMI problem for a worse one!

>My current solution is to stay off 15 meters, which so far hasn't been a great
>limitation.

Perhaps your electrician could help you lengthen the cable to add
1/8 wavelength to it? This could probably be done anywhere in the line
and just might solve the whole problem nicely.

If any of our usenet readers has, or finds, a fix for GFI EMI, please
let me know! I will personally carry it to our Hints and Kinks editor,
who will probably publish it. If you get published in Hints and Kinks,
you will not only be world famous, but we give you $20 besides, not
enough for a new rig, but it will probably pay for the ferrites. :-)

Good luck, and let me know if I can help,
73 from ARRL HQ, Ed

In article <1618@arrl.org> ehare@arrl.org (Ed Hare - KA1CV) writes:
>
>All work done on your house electrical system must conform with local
>code. Most local codes require that work be done by a licensed
>electrician.

Most local codes permit wiring modifications by homeowners as long as it's Code compliant and is inspected by the county inspectors. Generally, an electrician's license is only required for third party work for hire. A permit may be required if the value of the wiring exceeds some dollar figure, in Georgia that's $300, but a homeowner can get a permit as easily as a licensed contractor. Note: if the structure is a multi-family dwelling, an apartment, or a business employing more than 25 people, or open to the public, more stringent rules often apply.

The above is not to say that unskilled amateur electricians should feel free to wire anything that they like. It's the responsibility of whoever does the wiring to make sure it complies with Code and is done in a workmanlike manner. That generally requires a certain amount of skill and experience. As a licensed electrical contractor, I have a vested interest in having the work done professionally, but I felt I had to point out that hiring outside workers is not normally mandatory for homeowners.

>lightning hit.

This is an old wives' tale Andrew. Any conductor sufficient to conduct the surge current when in air or soil is even better when embedded in concrete. Only in cases where there are *no* conductors embedded in the concrete can the resistance to the surge be high enough to cause heating that will "explode" the concrete. The one thing concrete is *not* is a good insulator to lightning surges. As a general rule, you should always use conductors in concrete tower bases, rebar will do, as part of your ground system. See my posting about Ufer grounds for details.

3995. Re: Cushcraft R7 antenna problem

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-22 15:21:09 UTC
From: ron@topaz.bds.com
Message-ID: <207815INN9g1@topaz.bds.com>
Source record: 280166

I tested my R7 and it works as specified in their little graphs (or better) on all bands except 30 meters. The 30 Meter trap is evidentally a known problem. Mine has it's resonant point well outside the ham band (great I guess, if I want to transmit on WWV). Cushcraft has offered others with the problem new traps (I didn't ask, 30 isn't all that important to me).

The Moon has a low albedo (about .07), so why not bring silvery powder
and scatter it around? Or a bag of flour would work.

I've wondered whether one could see the Lunokhod rover tracks, or
Apollo rover tracks, in a telescope. They are tens of kilometers
long. But they are only a few inches deep, so you'd need a *really*
low Sun angle. Probably wouldn't work.

The HD-10 is all solid-state, has a built-in speaker and paddle (using dip switches as contacts). It's probably the "long and skinny, with a sloping top" one you described. I used one for years with an external paddle, and was pretty happy with it. That one may not be compatible with newer rigs, but I'm not sure.

I believe the HD-1410 could be the memory keyer they came out with. The paddles are touch-sensitive, and I believe it is compatible with newer rigs. The keyer is iambic-only--there is no way to switch to "non-iambic" mode.

>wonder if they are going to license a KCBSAM ?

A nit, on the license document for a suffixed callsign, there is a hyphen between the basic call and the modifier. IE KCBS-TV and KCBS-FM. That's the legal form of the call. It doens't matter on radio, the hyphen is silent, but it does matter on TV where the callsign is shown. Maritime stations can also have 4 letter K and W calls, so CBS could have a KCBS maritime station in addition to the above. It couldn't "broadcast" though, so the answer remains 4. AM, or Standard Broadcast as the FCC calls it, normally doesn't get suffixed calls, but it can happen if the same base call is already issued to a TV or FM station. Note too that stations with calls that differ only by suffix need not be owned by the same company, though they generally are. Callsigns are "by request" for broadcast stations. A station can request any call from it's block that is not currently issued. A local station was smart enough to grab WKRP when that was a hit. Another bit of trivia, WKRP is based on WQXI in Atlanta where the chief writer once worked. My company once owned that station and I can say authoritatively that the TV show was based on real life. :-)

>Why bother paying for cable TV?

Around here, if you want to watch anything on TV at all (other than videotapes), you either have cable or a satellite dish....That, or you live in one of those areas where you actually can pick up a marginal signal with a good outdoor TV antenna on a tower. There are no local TV stations in Ft. Walton. Of course, the cable company sent us the same blurb about how they will not carry any of the local channels (e.g., Pensacola, Panama City, Dothan, etc.) if they want money. Too bad for those of us who live in apartments, etc....

Of course, as long as they don't touch the channels that ST:DS9 and ST:TNG are on, or PBS, I won't complain. If they touch any of those, however, they're going to catch all kinds of hell from me.

>outside of the local listening area.

That's right Mike, and the presence of those other signals *dilutes*
the local broadcaster's viewer base. So in effect the cable operator
is costing the local broadcaster revenue while making money off the
broadcaster's signal. It's not a win-win situation. IMHO the local
broadcaster should receive the same treatment by the cable operator
as WTBS or HBO. Both get paid per subscriber by the cable operator
for the priviledge of *reselling* their signals.

Clearly, then, if the contesting mobs descend upon your QSO and you
can't ask them to leave because they're not listening where they're
transmitting, then you should go to where they're listening and
politely tell them that they're transmitting on top of your QSO/net.

The RFI book and/or our EMI/RFI-Telephone package will lead you to
a solution.

>Sun eve - was on 6 working Michigan stations when my neighbour
>came over and said that I was audible in two of their phones (they
>have 7 - hopefully not bad news).

Definately good news! This clearly indicates that the problem is in
those two phones. Most likely, the addition of telephone EMI filters
will cure things nicely. If not, at least you can point out that
if 5 of the phones in the house do not pick you up, then something
is clearly different (and inferior) about those two phones.

I don't know about the regulation in other countries, but here in the
US the FCC is pretty much on the ham's side about telephone EMI. Page
18 of the FCC Interference Handbook clearly states that telephones (and
a host of other audio devices) that pick up radio signals are improperly
functioning as receivers.

I just did a post on the availability of our several EMI handouts. We
also have a bunch of files on our server. Those having an active
EMI problem should send a 9X12 SASE (3 units of postage) to our
Technical Dept Secretary and ask for the EMI/RFI Package. We also
have one on EMI/RFI-Telephone (plus a host of others).

>Has anyone found any particular filter or solution particularly helpful for
>6 meter or VHF RFI ? Suggestions are welcome.

The effectiveness of most telephone filters begins to roll off above
30 MHz. (The old Bell Z-100 or Z-101 filters rolled off above the
AM broadcast band -- use the new Z100-ZB1 for HF.) K-Com, a regular
QST advertiser, has a new filter designed for VHF. I recommend that
you try that one first. I am looking for feedback on its effectiveness,
so please let me know.

>I am also getting into their FM baby monitor (it operates at 49.99 Mhz)
>but I am less hopeul of solving that one due to its probable WIDE Front
>end - but will try.

Good call! FCC regs require that a label on the unit or in the owner's
manual clearly spell out its status -- it must not cause interference,a nd
if it suffers interference from other radio services it is not protected.
Perhaps you could point to the label and let them be mad at the manufacturer
who made it and did'nt tell them. :-)

>My ground is about 3 meters from the rig (as close as I can get), on
>the same side of my house as the neighbour. Would a 1/4 wave counterpoise
>on the rig help?

Probably not. In most cases, the problem is caused by fundamental overload
and the majority of your signal is coming from your antenna. Moving your
antenna farther away (the top of a 200-foot tower?) would help.

As always, feel free to contact me here at HQ about an EMI problem
that can't be solved by our literature or by your local experts
(Technical Coordinator here in the US). I will see if I can offer
some ideas or help.

From: blt+@CMU.EDU
Message-ID: <kg9myXa00iV1E1Zqk0@andrew.cmu.edu>
Source record: 280163

Scott,

Thanks for the clue about a CATV cable...

What you are hearing at 136.5 is the sound carrier from CATV channel 16 (pix 132, color 135.58, snd 136.5).

The intermittant beacon at 137.71 could perhaps be a subcarrier on that CATV channel, or a mix with other sources.

It sounds as if your addition of a preamp has enabled you to pick up leakage from the cable system. I think that the leakage is below FCC specs (if you were not able to hear it before the preamp), so your approach to the CATV company would have to be a polite one...

Filters will probably not help, I think. Changing the arrangement of your antenna in relation to the CATV cable would probably help.

Best wishes.

From: rmf@SantaFe.edu
Message-ID: <207d3d$hti@tierra.santafe.ede>
Source record: 280168

Has anyone out there played with NEC antenna modelling code to model phased arrays? I want to model a 3 element phased delta loop array relatively close to the ground with NEC. This means that I need to feed the array with signals 90 degrees out of phase with a binomial 1:2:1 ratio. I need example input files to help me specify the problem to NEC. Does anyone out there have any input files which would show me how to specify the phased signal input to each antenna. Does anyone have input files they think are helpful which I could look at?

Since I'm occupying bandwidth ... Has anyone modeled short helically wound antennas like a shortened yagi. Again do you have an input file I could look at?

Please send Email to rmf@santafe.edu.

Thank you,
Rob Farber

Yes, they do recycle the car wash water. They blow the cars dry too. But the final crevices, interior glass and hubcap cleanups are done by the afore mentioned wetbacks.
>
> For those who do wash their cars at home, under the area used is a

>
During the recent Southern California drought, the "water police" cited people for using hoses to wash driveways and cars. I was cited which I suppose makes me a member of the criminal classes.

> You forgot about them having to endure " Have a Nice day"

The wetbacks don't say that, just "thank" or Gracias as I slip them a dollar in exchange for my car keys. The cashiers (Mine is a plump Russian with low cut blouses) do inists on customers having a nice day though. But as George Carlin says "I don't want a loose lipped cashier to tell me what sort of day I should have".

Obradio. My local car wash uses CB radio to talk from the gas pumps to the cashier. They speak in Russian though, so who knows what they are saying.

I seem to remember a TV program, (NOVA I believe) that said one of the apollo missions left an optical corner relfector on the surface. In the program, some school was bouncing a laser off of it to measure the exact distance from the Earth to the moon.

>"non-iambic" mode.

The HD-1410 Micromatic is my favorite keyer. It's the one with the touch paddles and the membrane keyboard on the top, and can run off of any power supply, DC or AC, from about 8 to 18 volts or so. The other one the original poster described is the HD-10 (I think; I used to have one of those, too).

The touch paddles are the Micromatic's most controversial feature: folks either love them or hate them. They take a bit of fiddling to set up right, but once that's done, sending CW becomes almost effortless, with *no* motion of the paddles necessary (or even possible - they're fixed when in operating position, although removable for portability). Other folks I know, including a few who can ctually send faster than I can, hate them, though; they like moving paddles instead. Fortunately, you can hang external paddles off the Micromatic, too.

I think the best evidence that we landed on the moon is the laser reflector that was installed on the surface
of the moon. It was left there so that we could accurately measure the distance from the earth to the moon
by bouncing a laser beam off this reflector on the moon.
Though this device can't be seen by a telescope it can be "seen" by a high powered laser.....

i own two of these critters. my favorite for mobile cw work. reasons:
the micromatic is pretty heavy for it's size and won't bounce around too
badly. fewer errors in sending with these over the bencher or other
paddles.

also: if you have single band rig and band is dead, you can practice random
code groups at any speed :-) really something that i hate, but it's cheap.

>

Uh, as I understand it, and as I saw on the actual licenses of some of
the stations I worked for, the dash before "TV" or "FM" *IS* part of the
official callsign.

As I understand it there can't be a fourth station with a given "base"
callsign. KCBS, KCBS-FM, and KCBS-TV "fills up" all the available
callsigns.

Hey, that's a pretty good argument. Apparently a number of theatres think
so too. There are any number of second run theatres here in atlanta
that charge 50 cents admission. Pretty close to free. and there are
a bunch more that charge a buck. Think of the 50 cent admission as the
Morris Code of movie theatres, designed to keep the riff-raff out.

The rest of your argument was pretty stupid and was deleted.

4019. "-Battery" vs. Natural Power

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-22 19:25:52 UTC
From: andy@ideath.goldenbear.com
Message-ID: <T69J6B1w164w@ideath.goldenbear.com>
Source record: 280084

At first glance it appears that the "-Battery" category and Natural Power bonus criteria are the same (except for the 5-contact minimum for the latter) Looking closer, however, I notice that the Natural Power rules explicityly mention that only batteries charged from natural sources may be be used, whereas the "-Battery" rules do not. This conspicuous absence seems to imply that - while I can't run from a generator, I could run from batteries charged (beforehand) from a generator or mains.

This, however, doesn't make sense to me. I interperate the spirit of the natural power rules as rewarding the ability to PRODUCE power independent of maines or fossil fuels, more or less INDEFINATELY.

So, should I interperate the "-Battery" rules as strictly as the Natural Power rules? A battery is not a power source, and powering your rig from a battery says little about your preparedness for anything but the short term contingency. (yes, the first 24 hours after say, a natural disaster are the most crucial- but if we're going to be hard-core realists, nobody is going to go set up a windmill after an earthquake, yet the rules bother to suggest the option.)

Enough hair-splitting. I've got to go throw another log under the steam turbine. See you Saturday. 73

p.s. how about a bonus/category for generating all of your transmitter power through natural means DURING the FD perioud?

>that the zener voltage is higher than its PRV.

You are both correct. Do not use rectifier diodes like you would zeners.
As Gary says, you can damage the device. There are two types of breakdown
in p-n junction diodes: zener breakdown and avalanche multiplication. Zener
breakdown is non-destructive. Avalance multiplication can be. Avalanching
generally has a different I-V characteristic from zener breakdown. Unless
a device is designed to have zener breakdown, it may avalanche first.

Fred's comments about zener diodes are correct. You need to limit the
current through them to avoid damage. Current mirror circuits work
well for biasing them. Analog designers avoid using zeners in amplifers
due to their noise characteristics.

> This, however, doesn't make sense to me. I interperate the spirit of the
> natural power rules as rewarding the ability to PRODUCE power independent of
> maines or fossil fuels, more or less INDEFINATELY.

Not indefinately, just for 5 QSO's. I always figured this was an ecology type thing, not a practical emergency type thing. Had this been an actual emergency I'd probably be using a mobile station.

I don't see the dilema. Natural power says you have to use 5 contacts made from something natural. It has nothing to do with whether your main Field Day class is battery or not. What they are getting at that you can use a solar cell to chage up a battery, use it to make a QSO, and then let it charge up again. You can do this for your 5 Natural QSO's even if you are using a generator for everything else.

> So, should I interperate the "-Battery" rules as strictly as the Natural
> Power rules?

No, battery is just that, a storage device. Nothing said emergecies last for ever. This is however why Battery is a separate class, there's also classes for commercial power and home stations as well. You don't think that these are possibilities during an emergency? The last emergency I was in required portable operation but we had commercial power through the whole thing. There are times when you are going to have no power and able to use your fixed (home) station, etc... Probably one of the more reliable emergency power sources is a case full of alkaline cells from price club. You don't need to worry about getting more fuel for the generator or whatever...

> A battery is not a power source, and powering your rig from a
> battery says little about your preparedness for anything but the short term
> contingency.

Field day doesn't say mcuh about preparedness for anything but a 24 hour emergency (with a year advanced notice), if it does that much. There are better emergency preparedness drills than Field Day. Last year everybody was too busy operating a contest than to follow good operating practice by avoiding QRM-ing the net serving the actual emergency going on.

Evidence yes, proof no. The presence of human-made artifacts on the
moon doesn't prove that humans were ever there any more than the
presence of Voyager outside the solar system proves humans were *there*.

(Not that I doubt men were on the moon, but it *is* an interesting
discussion.)

4032. IC-W21AT help?

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-22 21:32:00 UTC
From: Chris Beasley <cb1p+@andrew.cmu.edu>
Message-ID: <Ag9rdE200YUo4l0MFY@andrew.cmu.edu>
Source record: 280093

Hey folks,
I have an IC-W21AT dual band HT and I have been receiving frequent signal reports of "low audio" with "good signal/carrier/quieting".

Folks have been telling me that I should crack it open and tweak a gain pot to turn up the mic gain. While I am plenty qualified to do this, I am reluctant to do so because after careful (I think ;-)) perusal of the block diags/schems, I don't see any gain pot anywhere in the mic amplifier section. Am I missing it or is there no pot? If there's not, how do I up the gain?

Is it possible that there is some other problem like low output power or bad antenna match (I use several ant's and I don't think the reports correlate to just one...) or somthing else?

Finally, I have found that I can enable the extended Rx mode by booting up the radio with #8 or #b held down. I did this. Now I am wondering if there is a way (short of reset) to get it out of this mode?

Thanks in advance for the collective net.wisdom!

73!

SB SAREX @ AMSAT $STS-57.005
STS-57 Element Set GSFC-007

The following Keplerian element set was generated by Ron Parise, WA4SIR at
the Goddard Space Flight Center for the STS-57 SAREX Mission.

This element set is expected to be valid until the next orbiter burn which
is to occur at 1/18:00. Launch occurred at 13:07 UTC on June 21.

STS-57
1 22684U 93 37 A 93173.63536001 0.00001585 00000-0 31158-4 0 72
2 22684 28.4618 305.9163 0043081 55.2431 305.2214 15.42493569 180

Satellite: STS-57
Catalog number: 22684
Epoch time: 93173.63536001 (22 JUN 93 15:14:55.11 UTC)
Element set: GSFC-007
Inclination: 28.4618 deg
RA of node: 305.9163 deg Space Shuttle Flight STS-57
Eccentricity: 0.0043081 Keplerian Elements
Arg of perigee: 55.2431 deg
Mean anomaly: 305.2214 deg
Mean motion: 15.42493569 rev/day Semi-major Axis: 6816.8848 Km
Decay rate: 0.16E-04 rev/day*2 Apogee Alt: 467.86 Km
Epoch rev: 18 Perigee Alt: 409.13 Km

NOTE - This element set is based on NORAD element set # 007.
The spacecraft has been propagated to the next ascending
node, and the orbit number has been adjusted to bring it
into agreement with the NASA numbering convention.

4034. Yaesu 5100 scan memories

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-22 21:38:44 UTC
From: nigelt@microsoft.com
Message-ID: <1993Jun22.213844.24328@microsoft.com>
Source record: 280104

Does anyone know how to use the 1L and 1U band limit memories on a Yaesu 5100?
I've got the L and U pair to do what it says they should do and I thought that
the 1L and 1U pair did the same thing but for a different freq range. Apparently not.
If I set L and U for one range and 1L and 1U for another range then start scanning from the
1L freq, the scan goes up to the 1U freq but restarts at the L freq not the 1L freq

Reply here or email me direct: nigelt@microsoft.com

At last! Looks like uk.radio.amateur has appeared. Not sure exactly *when*
cos I was on holiday when it happened, but it seems to be there now.

So, to all UK amateurs (and other interested parties) reading this - how
about posting an "I'm here" message in there to get the group under way
and to prove you are receiving it OK.......

4040. Ground Rods In Concrete

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-22 23:01:23 UTC
From: match@sky.civil.utah.EDU
Message-ID: <57684.match@sky.civil.utah.edu>
Source record: 280098

>In article <C8zqDH.3In@news.claremont.edu> aross@jarthur.claremont.edu (Andrew M. Ross)
writes:
>>
>>Putting ground rods through or into concrete is a Bad Thing. I've heard
>>stories about concrete slabs (usually tower bases) that exploded when
>>lightning hit.
>
>This is an old wives' tale Andrew.

You are wrong Gary. My brother bought a house that had a concrete pad
with a 4" pipe sticking up out of it. Originally it was installed to
mount the dish for a TVRO reciever, that the previous owner took with
him. He (my brother) decided that this 4" pipe was a perfect thing to
mount his CB vetical, so he dropped a another pipe into this one, (it
dropped in six feet) went up 30 feet and installed his vertical.

About a month ago he incured a direct lightning hit to the vertical.
The concrete exploded! Great chunks of concrete flew over the top of
his roof and landed in the street. It cracked his swimming pool. It
melted his pipe/tower in half. It cracked the foundation on his house
and on his neighbors house, and blew out his elctrical distribution
panel, damaged most of the electrical appliances in the house including
his dishwasher and garbage disposal, even though these were obviously
grounded. Looks to me that the path was through the tower to the concrete
base, through the ground and into the house wiring VIA its grounding!
(before someone flames me, the current actually flows from the earth
to the sky in a lightning strike, but we observe it as though it's the
other way 'round)

As you have pointed out elsewhere, when concrete cures, there is alot
of entraped water that doesn't enter the chemical reaction. This free
water is one of the very things that makes concrete a good conductor.
The trouble is, during a lightning strike the high heat turns the water
into steam, and the intense pressure caused by the entrapped steam
causes the concrete to burst violently. Same as when lightning strikes
a tree. It's not the electricity that cuts the tree in half, the tree
splits due to steam pressure.

>Any conductor sufficient to conduct
>the surge current when in air or soil is even better when embedded in
>concrete. Only in cases where there are *no* conductors embedded in
>the concrete can the resistance to the surge be high enough to cause
>heating that will "explode" the concrete.

Wrong again. Think about it. 10,000-100,000,000 amps through a 1-5 ohm
resistor is going to have to dissipate one heck of alot of power. It does

this in the concrete base by making steam. Also, even a relatively small conductor (small like a 1/2" rebar) will conduct all this current until it melts in two, and by then the surrounding air is ionised enough to sustain the discharge.

You could maybe disribute the load by parralleling a bunch of ground connections, but if you observe lightning paths, you'll see that even when several paths to ground exist the discharge will prefer ONE, seemingly for no aparent reason, so you still loose.

>The one thing concrete is
>*not* is a good insulator to lightning surges. As a general rule, you
>should always use conductors in concrete tower bases, rebar will do,

>
>------------------------------
>
Gary, working in destructive testing you should know better. I'm not saying that conductors placed in concrete are not good electrical grounds, you're very correct on that point. Ufer grounds are excellent, but remember they're intended to prevent relatively small discharges from setting off bombs, not to dissipate a lightning strike. I've seen this exploding concrete thing and I'm a believer!!

June 18, 1993
Relayed by KB8NW/OBS & BARF-80 BBS
To all radio amateurs

SB PROP ARL ARLP024
ARLP024 Propagation de KT7H

Solar activity continued to decline last week. Sunspot numbers went
as low as 11 and flux went down to the low eighties. There were
almost no visible sunspots.

Solar flux will begin rising after this weekend and should reach a
modest peak near 120 around the end of the month. This next
activity is expected from returning region 7518. Geomagnetic
activity should be mostly quiet but there could be some upsets
around the first of July, and again around July 7.

Sunspot Numbers from June 10 through June 16 were 61, 44, 33, 24,
11, 11 and 11, with a mean of 27.9. 10.7 cm flux was 112.6, 101.8,
93.3, 86.6, 83.7, 82 and 82.3, with a mean of 91.8.

The projection for this week is from Omaha, Nebraska to Libya. 80
meters should be open from 0130 to 0400z, peaking around 0230. 40
meters should be open from 0000 to 0530z, peaking from 0230 to 0400.
30 meters should be open from 2300 to 0600z, peaking from 0100 to
0430. 20 meters should be open from 2200 to 0630z, with the best
times from 0000 to 0500. 17 meters should be open most days from
1730 to 2300z. Due to low solar activity, 10, 12 and 15 meters do
not look promising over this path.

SB DX ARL ARLD032
ARLD032 E35X wrap up

NORWEGIAN DXPEDITION TO ASMARA, ERITREA MAY 31 - JUNE 9 1993

The following from Erling Wiig, LA6VM, was received at ARRL HQ
today:

The DXpedition was warmly received in Eritrea and its objectives
were achieved.
- Introductory seminars held at the Telecom Authority of Eritrea
and at Asmara Technical School.
- Asmara Technical School Radio Club was started with elected
chairman and 26 members.
- Code training is in progress.
- A complete station, including Icom IC-751A, IC-2KL, IC-AT500, a
Mosley TA33 and dipoles was set up at the radio club.

A three day seminar was held at the Telecom office, with about 15
participants. A four day seminar was held at the Asmara Technical
School, with about 35 participants. The technical literature --
about 15 ARRL manuals and 20 sets oflecture notes -- represents the
first updating of technical literature at the school in decades.
The radio equipment replaces 40-50 years old nonworking equipment.
Amateur radio is now being used in the lectures to visualize and to
give hands-on demonstration of electronics and communication theory.
Code training classes continue with the provided training tapes,
cassette players and keys. The setting up of the club station was
attended by over 100 persons and was covered by the Eritrean press,
radio and TV.
```

The expedition started at 1830z June 1 with the assigned callsign E35X. The operation closed June 9 at 0620z. about 20,000 QSOs were made with about 125 countries. The operation took place mainly on 10, 15 and 20 meter SSB and CW with some contacts on 40, 80, and 160 meters and on RTTY. Operators were LA1EE, LA6VM, LA9DL, JF1IST. In addition, Eritrean hams-to-be participated in the operation, marking the start of amateur radio in the independent Eritrea.

QSL via LA6ZH, Ruth Tollefsen, PO Box 17 Tveita, N-0617 Oslo, Norway, one card per QSO please. Cards will not be ready for 6 to 8 weeks. Cards received direct will be returned direct provided an SASE and sufficient postage is included.

SB DX ARL ARLD031
ARLD031 DX news

Thanks to Chris, KD3OA; Karl, PS7KM; Bob, W5KNE; and QRZ DX for the
items in this week's bulletin.

SAINT PETER AND PAUL ROCKS. The NATAL DX Group, a Brazilian
organization, plans to be ''on the rocks'' for three weeks starting
sometime in January or February 1994. This may turn out to be the
first time PY0S is available on packet and satellite. PY0SK and
PY0SP will be manned by four operators running the two stations
nearly full time. Plans call for CW, RTTY, SSB, packet and
satellite modes. QSL SSB, RTTY, 6M, packet and satellie via PS7KM.
QSL via PT7WA for only HF CW contacts.

DODECANESE. Look for N6MZ on OSCAR 13. He is sailing the Aegean
Sea and will be visiting SV5QR June 19, 20 and July 4. This may be
the first time SV5 has been active on satellite.

FRENCH POLYNESIA. JA8GMZ, JH8FMK, JR8FEK and others will operate
from Tahiti for one week starting June 22. Look for them on 160
through 6 meters with CW and ssb.

MARION ISLAND. The operator signing ZS8MI is Christie, ZA1CDK,
Check 14130 and 14168 kHz. Christie sometimes checks into the net
on 21205 kHz at around 0500z.

LIBYA. Strong signals from 5A0RR were heard Tuesday evening,
Eastern time. Wednesday night was a no show and there has been no
additional news received as this bulletin was being prepared late
Thursday afternoon.

HEARD AND WORKED from the east coast recently include

>From ARRL Headquarters Newington CT
June 10, 1993
Relayed by KB8NW/OBS & BARF-80 BBS
To all radio amateurs

SB DX ARL ARLD030
ARLD030 DX news

Thanks to Bob, W5KNE QRZ DX; Tedd, KB8NW; Jose, CO2JA and Noel,
9Y4NED for the items in this week's bulletin.

BELAU. a multi-op effort by the Kyoto ARC of Japan is slated for
August 8 through 13. Plans are for CW, SSB, FM and RTTY on 160
through 10 meters. QSL via JA3OIN.

LIBYA. The first week of june has come and gone with nothing heard.
Have any other PacketCluster users configured a hot key for the
command SH/DX 5A ?

MARION ISLAND. There has been some sporadic operations from ZS8MI
recently. Spots are few and info is sparse. QSL via ZS5UND.

ALBANIA. ZA1Z has been quite active this past week on 40, 20 and 17
meter CW around 0200z. QSL via HB9BGN.

NORFOLK ISLAND. VK9NL can frequently be found generating pile ups
with snappy CW at 0200z near 21025 kHz, QSX up.

JF2MBF TOUR OF THE PACIFIC. Nob, JF2MBF, who operated VR6BB and
VR6JJ with Hiro, JA1SLS, this past Winter and Spring is now signing
ZK1AJJ from Rarotonga of the Southern Cook Islands. His future
stops will be the Northern Cook Islands from June 12 to 25, the
Southern Cook Islands from June 26 to 30, and Fiji after that.
Tuvalu is also one of his targets before returning to Japan. He
operates all popular modes including RTTY on all bands including
OSCAR 13. QSL for VR6BB and VR6JJ go via JF2KOZ. QSL AK1AJJ via
JA2TBS.
```

TRINIDAD AND TOBAGO. The Trinidad and Tobago Amateur Radio Society, TTARS, reports June 14 through 20 will be amateur radio awareness week. 9z4sxt will be active from 1400z June 18 through 2200z June 20. QSL via WA2NHA.

CUBA. Jose, CO2JA, adds to last week's bulletin, ARLD029/DX CW29, that the VHF DXpedition group to operate in the ARRL VHF QSO Party this weekend will be checking 3818 and 3843 kHz for meteor scatter schedules in the evenings, and 28885 kHz for 6 meter schedule coordination. QSL via CO0FRC, PO Box 6060, La Habana 10600, Cuba. Please include SAE and sufficient IRCs or return postage.

EARLY IARU CONTEST NEWS.

WV2B will be on from Saint Paul Island signing /CY0 from July 9 through 12.

Saint Pierre and Miquelon will be activated by a group of W8s signing /FP from July 9 through 13 with CW, SSB and RTTY on 160 through 10 meters. QSL via NU8Z.

THIS WEEKEND ON THE RADIO.

The ARRL VHF QSO Party starts at 1800z and runs for 33 hours. We remind you there has been a rule change for rover entries for this and other ARRL VHF operating events. See page 125 in May QST for details.

The ANARTS Worldwide RTTY Contest, sponsored by the Australian National Amateur Radio Teleprinter Society, runs from 0000z June 12 through 2400z June 13. For more information, check page 117 in June QST.

4047. Scanners (Advice Inquired)

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-22 23:52:14 UTC
From: thweatt@rtsg.mot.com
Message-ID: <thweatt.740793134@corolla24>
Source record: 280111

I am interested in buying a scanner. I have been looking at the IC-R100 and started to look at the AR-2500. The purpose of this scanner is to allow me to get aquainted with the frequency spectrum. I was interested in a scanner which will open up the whole spectrum for me for around $500. This is why I have been looking at these two scanners.

I found out that the IC-R100 has only around 100 or so memory channels and a scan rate of about 10 channels per second. It looks like a good radio but I don't like these drawbacks .

I was also interested in the AR-2500 this has RS-232 control and covers about .5 - 1300 MHZ with a small section of the band taken out between 600 - 805 MHZ (UHF TV). But a dealer said that he stopped selling these radios since the squelch and BFO would go bad on them and people started sending them back. (Galaxy 216-376-2402)

I also looked into the Bearcat scanners, but they looked like they were not continuous scan and I had some doubts the quailty??? Also I would like to get short wave also. A dealer said he could modify this scanner for me which would open the frequency range up for me. I did like the 100 channels per second feature.

I am open to ideas.

Does anyone, on this net, have any experience with one of these scanners or any advice which could help me in my decision.

Thanks,
John Thweatt

In article <132683@netnews.upenn.edu>,
depolo@eniac.seas.upenn.edu (Jeff Depolo) writes:

| Anyone out there in netland have a 1.2 GHz repeater on the air? I'm
| looking for comments/suggestions for antennas and duplexers (if
| anyone makes them). Thanks.

Rather than going to the expense of silver-plated cavities (which
probably aren't necessary anyway, but we needed to get the system up
and running ASAP for political reasons since it was a donation), we
just used two antennae for VK2RWI; Rx on top, and Tx at a suitable
distance below.

From: brian@nothing.ucsd.edu
Message-ID: <2086rhINNc7n@network.ucsd.edu>
Source record: 280105

Yes, the result of the vote WAS posted, but it never appeared here at UCSD in the ham radio groups. I did see a response to it in one of the other groups I read, and went looking for it in news.groups (which I don't normally read). Dave Lawrence of UUNET happens to be sitting at the terminal next to me (here at USENIX) and I watched him create the new groups, so they're real.

I have no idea why the result wasn't posted here; if Ian or one of those people DID post it, it never made it to UCSD.

I haven't decided what I'm going to do about the associated mailing lists yet. There's no hurry (it's only USENET!) and I want to do the right thing.
- Brian

Hi Brian,
I decided to email rather than post because you will probably get
a ton of mail about this. :-) The results were posted in all rec.radio.*
groups that I read. That was about two or three weeks ago. I didn't post
the results naturally but I did see them.

Welcome to the fifth exciting, thrill-packed issue of Condo Communicator, a newsletter devoted to those amateurs who, for various reasons, must configure their stations to operate from restrictive areas such as condos, apartments, townhouses, neighborhoods with outdoor antenna restrictions, ships/boats, mobile homes, or wherever they fry their burgers and call QTH.

Station Descriptions 3
Dave, W8NF; Howard, N9RUI

SOAPBOX

Whilst struggling to get a little homebrewed transmitter to work, I gave some thought to the concept of matching. Just as it's important to match the impedance between different circuit components to maximize the transfer of power, it's important to have a good match between your ham radio activities and station requirements in order to maximize the pleasure you can derive from the hobby.

For example, if you enjoy providing telephone patches between overseas military personnel and their families stateside, you'll derive considerable pleasure from smoothing the radio links for troublefree communications. It certainly is no waste of money to purchase the best equipment available, including beam antennas, high and sturdy towers, and amplifiers to overcome any obstacles placed in your path by mother nature. In this case, there is a good match between the activity and the station, maximizing the pleasure derived.

But if you live in an apartment, you're going to face considerable frustration pursuing the same activity. Even with sensitive receiving apparatus and an amplifer, you'll not provide the same quality of communications as often as the fellow with the space for large antennas. The families you're trying to help will not be happy with

the scratchy and fading signals. In addition, your neighbors will certainly not appreciate the RF overload into their televisions and other appliances, and they will quickly let you know of their displeasure. Given such a mismatch between the activity and the station, you'll not derive much pleasure.

On the other hand, if you enjoy just trying to get a signal out of a "covert" location, then living in that same apartment could provide a

great deal of fun indeed. Imagine the jollies I got when receiving a QSL card from a station I worked in Finland on 20 meters with less than a watt into an attic wire loop. Or the fun of building a small transmitter and getting it on the air, with no RFI and good, solid contacts. (So what if I had to seek troubleshooting advice from all my friends and loads of folks on Internet and packet?) The point is, there's a good match between my activities and station capabilities given the set of environmental restrictions within which I choose to live.

If you find operating from restrictive space frustrating, you may want to try reconciling your operations with your circumstances. If you want to run overseas phone patches from your apartment, you can fight the unit's management to install a tower, fight your neighbors so you can run high power, make a scientific breakthrough in the science of wave propagation, move, abandon the hobby, or you can examine what you're doing to see if you can make any modifications to produce a better match with your station and operating restrictions.

TECHNICAL ADVICE

Dave, W8NF of Denver, Colorado, offers some advice about radio frequency interference. I had mentioned RFI problems with an old DX-20 transmitter. Connected to a dummy load, and sitting on top of the family TV, the DX-20 produces zero interference. But, just hook it up to the attic antenna and the TV picture gets wiped out, worst on channel 2 but bad enough on all the others.

Dave says:

1. Reduce RF currents on the coax. Wind the coax at the feedpoint to the antenna into a coil, about 5 or 6 turns at 6 to 8 inches diameter.

2. The signal from the antenna is probably coupling into the AC power lines, and from there it's saturating the TV tuner. Filter the TV's AC line. As the first element, use some series impedance, like a ferrite bead or coil.

I wonder what would be a good ferrite composition to use and if anything of the appropriate mix is sold that will just clamp over the AC cord. I've had no luck with the variety sold by Radio Shack.

Anyway, for those of you having similar problems, give Dave's suggestions a try.

Some more technical advice from Dave regarding limited space antennas, who suggests using the G5RV design. As radiation from a wire antenna occurs at high current points, then it's important to get the middle of a center-fed antenna (the high-current point) as high as possible, and it's less important to get the ends as high. Neither is resonance as important as getting as much current as possible into the wire. If you're not overly concerned about directivity or radiation angle, and if you can match the thing, then you're getting current into it, and it'll emit a signal.

The G5RV antenna is essentially a configuration of wire that shows an SWR of less than 5:1 on all bands when no tuner is used. The G5RV is a center-fed, 102-foot wire. You feed it with ladder line that's

about 30 feet long (or 1/2 a wavelength at 20 meters). Now you have an antenna that's 3/2 wavelength of 20 meters and resonant on that band. Then, to the ladder line, attach your coax, first making a coaxial balun composed of 5 to 6 turns at about 6 to 8 inches in diameter. This produces an impedance at the transmitter side of the coax that most tuners can match from 80 through 10 meters.

If, like me, you don't have enough room in your attic for 102 feet of wire, even snarled, then Dave suggests cutting everything by half for an antenna you can match from 40 meters through 10 (with a tuner). That means a 51-foot length of wire, center fed, with the open wire feeder cut for about 15 feet (a half wavelength on 10 meters).

STATION DESCRIPTIONS

While we're on the topic, Dave will be using the G5RV design at his new house where the attic is larger. Currently, Dave lives in a house with two attics. His station is:

1. Tiny attic: 6/10/15 meter dipole. Also works on 12 and 10 meters. No tuner. 10 watts. No RFI.
2. Larger attic: 40-meter dipole, with center point as high as possible and the ends "bent, twisted and gnarled in whatever shape needed to get the thing to fit."
Tuner used. Won't match on 80 or 20, but operates on 40, somewhat on 15.

When Dave fires up the SB-220 amp, however, his garage door goes up and down!

As you know, I've asked folks who live in buildings higher than two stories to send in their station descriptions. While no one living in on the 20th floor of an apartment has sent in anything yet, Howard Miller, N9RUI of Skokie, IL, near Chicago, has sent in a description

of his third-floor setup.

Howard uses an inverted vertical. It's made of thin magnet wire and is 35 feet long. With a small stone weight on one end, it's lowered from the window and blends in nicely with the brickwork on the side of the building and can't be seen. Howard has taped two counterpoise wires in opposite directions to the inside wall near the floor of his apartment. With this setup and a one-watt HW-8 Heathkit rig, Howard has worked into Indiana on 40 meters.

Howard's inverted vertical works fine from his third-story perch. I wonder how height affects the signal pattern of a vertical. Is the low-angle radiation of a vertical enhanced by being elevated? Although the building would block a good part of the signal, would an inverted vertical hanging from the 40th floor of a high-rise radiate as well in the free-space direction as an inverted vertical nearer to the ground? And what does inverting the vertical do to the signal pattern? Some of you antenna wizards write in and let us know. You could be helping a high-rise ham.

The newsletter is pretty short this month. After all, it's only as long as you make it. So, if you'd like more station descriptions and less editorializing from me, then send your notes, ideas, station description, war stories, editorials, and so on to me at:

4053. Field Day Publicity Article

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-23 02:19:55 UTC
From: w1gsl@athena.mit.edu
Message-ID: <208ekb$98o@senator-bedfellow.MIT.EDU>
Source record: 280110

Here is the text of an article submited to the Boston Globe.
A slightly edited version appeared in the Sunday 20 June issue.

It and a simmilar article published last year explain Field Day
and Ham Radio and invite the public to visit. A list of over 25
local FD QTHs followed. Last year the article was very well
received. In fact one of the local cable news orgs used it
practially verbatium as voice over for their video coverage
of the Billerica MA club.

Feeel free to use this as you can, please give W1BG credit
if you use it intact...
73 Steve F
W1GSL

Next weekend, June 26 and 27, local Radio Amateurs will be
participating in the annual Field Day exercise sponsored by the
American Radio Relay League. Field Day is fun with a purpose:
it's an emergency communications drill disguised as a combination
radio contest and public awareness exhibit. Hams try to contact
as many other stations as possible in a 24 hour period. Their
performance is scored by a set of rules tilted to favor temporary
stations set up in parks and other areas with easy public access.
Local radio clubs will begin putting up their Field Day stations
late Saturday morning, and you're invited to drop by to see what
the hobby is all about.

Ham radio is primarily about electronics and communications. In
exchange for passing an FCC sanctioned exam, radio amateurs are
given access to a wide range of operating frequencies and
communications modes. Hand held walkie talkies are probably what
the general public sees most often, but these are primarily for
local (5 to 50 miles) communication. Field Day operations are
typically centered around short wave transceivers with world wide
capabilities. Voice transmission modes are a favorite with many
operators, but morse code is a close second choice because of its
reliability under marginal conditions.

Ham radio is also about contests, and Field Day is one of the
oldest. It's designed to encourage hams to assemble the
equipment and skills needed for emergency communications. That
means being independent of commercial power and the
sophistication of a permanent home station. The event is scored,
with points being awarded for each radio contact. There's also a
system of bonus points awarded for operation with different modes
and transmitter power ranges. Low power sets earn more points

because they're more representative of a true emergency setup. They're also easier to move, easier to run from batteries, and can be put on the air with less fuss. Bonuses are awarded as well for using alternative energy sources (solar, wind, or even muscle power!), contacts via computer and amateur satellites, and for having public information displays. Hams see Field Day as a good excuse to get outside for a weekend of picnicking and radio. For the public it's a wonderful opportunity to learn more about this fascinating hobby.

Field Day stations will be sprouting up all over the area on Saturday morning. Open fields and hill tops are a favorite spot because they make antenna erection easier. Many clubs also favor town parks and shopping malls because of increased publicity and visitor access. The following is a list of locations to be used by some of the larger radio clubs in the Boston area. You're encouraged to drop by and visit any of them during the contest (which runs from 2 PM Saturday until 2 PM Sunday). Many stations will be on the air around the clock, so there's no such thing as too late at night or too early in the morning!

4054. STS-57 Update/President's Crew Conference

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-23 03:30:37 UTC
From: ABFHB@STDVAX.GSFC.NASA.GOV
Message-ID: <930622233037.21a0b35f@STDVAX.GSFC.NASA.GOV>
Source record: 280113

SB SAREX @ AMSAT $STS-57.006
SAREX Update/President's Crew Conference

The Shuttle Amateur Radio Experiment (SAREX) is activated and fully operational on the Space Shuttle Endeavour. The initial engineering contact with W5RRR went well. Pilot Brian Duffy's (N5WQW) family were on hand at the JSC ARC during the pass. In fact, Duffy's son Shaun, KB5SIY, initiated the contact for the engineering checkout.

Two orbits later, the students at the Mitchell Elementary School in Houston had an outstanding, crystal clear contact with 11 students asking questions.

The school contact with the Lawrence Hall of Science and Malcolm-X Intermediate School had limited success today on the following orbit with 2 students asking questions. An unfavorable Shuttle attitude limited SAREX success during this pass.

SAREX and amateur radio, in general, received a big boost today when President Clinton had a telephone conference with the STS-57 crew. During his address to the astronauts, President Clinton commended the astronauts, the SAREX team and the amateur radio community for their outstanding support to students around the world. Clinton said "I understand that later in the mission Janice (Voss) and Brian (Duffy) are going to be talking with school children around the world." He continued "But I want to tell you how much I appreciate the fact that you're making an international education project out of this mission. That's very important to me." Pilot Brian Duffy responded "Mr. President, we find that using amateur radio is an excellent way of communicating with children all around the world, and we're also able to excite them by using space and science. And letting them see space and science in action, we're able to excite them and hope they'll study harder." The President finished, "You have no idea -- you may be on this mission creating thousands of scientists for the future just by the power of your example and by this direct communication. I think sometimes we underestimate the impact that human contact in an enormously impressive setting like this can have on children all across the world--not only those with whom you'll talk, but millions of others who will just see it and know that it happened"

Submitted by Frank H. Bauer for the SAREX Working Group

Cecil A Moore (Cecil_A_Moore@ccm.hf.INTel.COM) wrote:

: Sorry, guys, for the confusion. I had a misplaced modifier. What I
: really meant to ask was, "Which is correct, 2.3 db loss at 330 MHz or
: 3 db loss at 330 MHz?" As it turns out, the ARRL handbook is correct
: and the loss at 330 MHz is closer to 2 db than to 3 db.

Cecil,
Now that the confusion is clarified I'll muddy it slightly again.

Watch out that the cable you have really does show smooth and
monotonic loss versus frequency. The last 250' roll of 9913 I bought
had a problem: It showed several rather deep and narrow loss spikes
when I carefully swept it over .3MHz - 3 GHz. I don't have the plot in
front of me but I remember an *additional* 2-3 dB at about 290 MHz! I
investigated it and determined the problem to be due to periodic
imperfections across the length of the cable. Any one of these alone
was small and hard to see, even in a time domain analysis with error
correction applied, but the total effect was very significant. As you
might expect, the spikes showed up at multiples of the lowest frequency
but the normal cable loss tended to swamp out the effect at higher
frequencies.

I landlined with an applications person at Belden and FAXed plots of
the problem along with my complaint but didn't get any help except his
admission that they normally only do spot frequency tests and don't
sweep cable to reveal that kind of problem.

I determined that the problem was at manufacture time and not just an
effect of some kind of damage of my particular roll by seeing that the
periodicity was not related to the turn size on my roll. I guess the
bottom line is measure before you use if you are truly concerned. You
may not get what either the manufacturer or any on the standard references
suggest.

Hmmm... now that you mention it...

Some sites may filter out articles which are cross-posted to what they consider "too many" newsgroups. (News admins can do just about anything they want with their systems.) The results were cross-posted to quite a few: news.announce.newgroups, news.groups, rec.radio.amateur.misc, rec.radio.amateur.packet, rec.radio.amateur.policy, and rec.radio.info.

That may have been enough to cross the threshold for some sites.

Since you pointed this out, I put a copy of the full text of the results, as received here at Amdahl, in the FTP archive on ftp.amdahl.com in /pub/radio/amateur/vote-results.Z.

So I build a rocket in my back yard, emigrate to the moon, and issue myself what must be THE most attractive DX callsign (for a while at least).

When I call CQ on 2 metres, all hell is going to break loose.

There's obviously going to be a lot of response, but if folk call on frequencies not already in use, I can tune around and pick them out at random. That seems fair and about the best I can do.

These people are reasonable and responsible types they know better than to interfere with already established QSO's it's forbidden in the terms of their licences and it's bad manners as well.

I think we need to not lose sight of the difference between someone, perhaps foolish enough to appear on a band and suggest he is listening over a wide range, and those stupid enough to trample everything flat.

Who is the stupid one ? the one who suggests bear wrestling, or the one who tries it ?

Cheers
David

>*can't* learn all the answers? I wish my University finals were published
>in advance - would have been a *lot* easier :-)
>

The exams are made public for a couple of reasons, first, it exposes the process to public review. The FCC claims that hams are examined on certain items and publishing the pool documents their claim. Second, it's published to prevent cheating on the part of the people who administer the exam. The requirements for getting a license are publicly known. Those who would make it easier AND THOSE WHO WOULD MAKE IT HARDER by changing the questions are breaking the law. Since the pool is known, a person is free to challenge it.

Some people claim they can be memorized. My take on it is that the person who goes to the trouble of memorizing several hundred questions and answers shows more dedication than the person who memorizes the few equations and works them out. ;-)

In fact, MOST of the exams require more memorization than anything else -- band edges, operating practices, etc. can't be derived or calculated. In short, the whole memorization thing is a red herring.

>Bring back some technical requirement to amateur radio world-wide. We have
>the allocations because we are supposed to use them for self-training and
>(hopefully) some serious experimentation. If the various administrations around
>the world see amateur radio turning into a glorified CB then that might be all
>we get left with after the commercial concerns have swiped our bands.

Are you saying that EVERYONE has to self-train and experiment? I can't speak for the UK, but in the US the vaunted "Basis and Purpose" statement at the head of the regulations mentions those as some of the reasons for having an amateur service. I don't think it would be a correct reading to say that people are required to do each and every one of the the things specified -- they're free to pick the ones that interest them. By doing that, amateur radio as a whole meets it's purpose because *some* people experiment and *some* do public service and *some* promote international goodwill, etc.

Unless you can show that NO experimentation or self-training is going on, I don't think you can say that the service is failing to meet its goals.

I just ordered some Maxon ear mikes with cables for 12.50$ each. it was
real easy. call 800-555-1212 and ask for the Maxon number. call it,
ask for parts. The Maxon folks will tell you what they have but don't
have the specs handy. they take master card, visa and maybe one or
two others. Shipping is 3.50$ processing takes 2 days and shipping takes
5-10 days.

now all I got to do is figure out how to adapt these ear mikes to my 2at
for bike mobile and my ft-290 for car mobile.

>a formula if one exists?

This isn't as simple as it looks. You'd think that coax with 20-30 pf per foot would appear as a near direct short to RF, but it doesn't. The distributed capacitance *and* inductance of a properly terminated cable form a low pass filter of a type called a halfwave filter. Below cutoff, it's losses are low, essentially only the R losses as the currents circulate from L to C to L to C.... down the line.

>Anyone else been down this path? Any suggestions?
>73, Harold, N4FLZ
>hgpeach@ms.uky.edu

Well, the really important question is how does it work? Does it seem to
perform well? Measuring SWR in VHF/UHF mobile installations is tricky at
best. You can't measure it at the antenna, so you have to measure it at
the diplexer or at the rig, which gives you perhaps an erroneous reading.

I've never been a big fan of window mount antennas, and especially the
cellular look alikes (even the mag mounts leave something to be desired).
However, if you're not getting a high SWR light or indication from your
radio, and, if you seem to be transmitting and receiving OK, chances are
your installation is OK.

If there's any way of measuring it at the antenna, you may want to look
and see what it reads.

1. Why do you say PVC is bad at HF? It is certainly a nonconductor.
The use of PVC may have HF limits because of flexibility in long
large HF beams, but I'm unaware of any other PVC shortcomings.

2. I've dual posted this to the new antenna newsgroup as suggested.

3. Just received my July QST. It has two more inexpensive 2m antenna
designs. One for a permanent mounting at home and another for
portable operation (e.g. on vacation, etc.)

COOK SAYS NO TO FCC POST

President Clinton's first choice to head up the FCC has told
the administration that she is no longer interested in becoming
the agency's chairman. Antoinette Cook was tapped back in
April to head the regulatory agency. She withdrew her name from
consideration on May 27th, after giving birth to her first child.
Cook's decision to withdraw herself from consideration for the
high post has caused a great deal of speculation among Washington
insiders. This, as to why one of the Clinton administration's
best qualified and best-connected candidates would take herself
out of the running.
She says that service on the FCC would have been a great
challenge and an honor, but that her life at this time is filled
with other challenges and honors, including the recent birth of
her son.
Cook adds that she will continue to act as Senior Counsel to
the Senate Commerce Communications Subcommittee, where she was
instrumental in shaping the new cable TV re-regulation law.
If she had been nominated and appointed, Antionette Cook would
have been the first black and the first woman to head the FCC.
Since the resignations of Alfred Sikes and Sherrie Marshall,
the FCC has been operating with three members. Commissioner
James Quello is its acting Chairman.

*****
INTELSAT LICENSING

The FCC says that it is seeking comments on a proposal to
eliminate the licensing requirement for certain international
receive only earth stations used in the fixed satellite service.
Although the agency has already abandoned the licensing
requirement for domestic receive only satellite earth stations in
favor of a voluntary program, in years past the agency has been
reluctant to give similar treatment to international receive only
stations. This, due to concerns about United States obligations
to Intelsat and Inmarsat.
But with world politics ever changing, and in view of ongoing
changes in the international satellite arena, the FCC now
believes there is no longer any basis for these concerns. It
also believes that deregulating international receive-only earth
stations will help to further the Commission's policies while
also increasing service options and simultaneously reducing
customer costs.
The only earth stations excluded from this proposal are those
operating as satellite terminal stations, those which are

operationally connected to a domestic common carrier and those used to exchange a carriers common traffic with the Intelsat satellite system.

*****
UK NOVICES ON OSCAR

The United Kingdom's Radio Communications Agency has confirmed a widely posted rumor that says British Novice Class operators have been given satellite operating privileges. The story first surfaced on packet back in February and was attributed to a national society news bulletin. It said that the 70 cm frequency allocation for UK Novice licensees had been expanded to include 432.0 to 440.0 MHz. This would give British Novices satellite access for the first time. But, until now there was no official verification forthcoming. As it turns out, the story is true and several British Novice stations are already active on the ham radio birds.
But there are a couple of restrictions placed on their operations. The United Kingdom limits Novice power to 3 Watts out, and this is already posing a challenge. But it is one that can be overcome. With 3W output, into an antenna with 17 or more decibels of gain, some British Novices are reportedly putting healthy signals into AO-13 when conditions are good.
Also, there are many hams on the satellites who don't believe that they are actually licensed UK Novices operators. Unlike their high grade G prefix fellow hams, Novices in Great Britain sport callsigns very reminiscent of the early days of Class D 11 meter CB radio in the United States. Their calls start with the number 2 followed by a letter which is followed by a Zero or the number 1 as the prefix. This is followed by a three-letter suffixes. The letter in the prefix indicates where in the United Kingdom a station is located. For example, 2E0AAA would be a Novice in England, while 2D1AAB would be located on the Isle of Man. A Zero in the call sign indicates that the holder has passed a code test and enjoys limited HF privileges. A number one is an indicator of no-code ham.

*****
RUSSIAN FEES

Still from the international desk comes word that Russian licensing authorities are imposing licensing fees on visiting western hams. A temporary operating permit that is good for up to thirty days is priced at thirty-five dollars. The Russians also plan on collecting up to one hundred and thirty-five dollars for their two year visitors license. Word is that these prices are subject to change without prior notice.

*****
EF JOHNSON REMEMBERED

An industry legend is about to be commemorated by some of those it served. The Viking Amateur Radio Society of Waseca, Minnesota, will celebrate the 70th anniversary of its parent company, the E.F. Johnson Co. The group plans to operate from one of the company's original buildings in Waseca on June 18th through the 20th and again during ARRL Field Day which is June 25th to the 27th.
The club has asked for special permission to use the call sign 9ALD, the original call of the company's founder Edgar F. Johnson who died in 1991. If that permission is not forthcoming from the FCC the club will use its own call sign, WA0CJU.

*****
SCOUT HELP

The organizers of the 1993 National Boy Scout Jamboree are soliciting assistance of radio amateurs to help staff the Radio Merit Badge tent at this years outing. The event is scheduled for August 2nd to the 9th in Fredricksburg Virginia. Hams interested in participating are requested to contact Ray Moyer, WD8JKV, at area code (214) 580-2595.

*****
GRUBB

The Dayton Amateur Radio Association says that it wants Dave Grubb, KC8CF to head up its 1994 Hamvention. Word out of Dayton is that the club was very pleased with the way in which Grubb managed Hamvention '93. The show pulled a record crowd. Exhibitors were elated with their record sales and compliments have been coming in ever since.

*****
UKRAINIAN CONVENTION

The first ever Ukrainian International Hamfest takes place August 21st and 22nd in Kharkov. Features include a seminar session sponsored by the Ukrainian Amateur Radio League, a DX-pedition report, awards, contests, slide shows and a great cultural program. Open forums will give everyone an opportunity to better know the UB5 hams. For further information please write to Igor L. Zeldin, UB5LCV, P.O. Box 4808, 310103 Kharkov, The Ukraine. Or you can inquire by packet radio to UB5LCV at the UB5LMJ BBS.

*****
BBC

GM2RW reports that the BBC's Radio 1 service can now be received on the European Astra 1 B Satellite. It is transmitted in on the audio-subcarriers of the UK Gold transponder. The frequency is 11.553 MHz with subcarriers at 7.38 and 7.92 Mhz. BBC Radio is the national radio program of the British Broadcasting Corporation and is transmitted in stereo on in Great

Britain.

*****
RUDAK SPEAKS PEACE

Peter Guezlow, DB2OS reports that the RUDAK 2 transponder on board Oscar 21 is now transmitting Junior's De Castro's Peace Message in the Russian language. This, in a female voice and in addition to the english voice. The FM mode repeater and 1200 Baud AFSK AX.25 Telemetry are also still in the schedule. Peter adds that a french voice will be uploaded to RUDAK 2 next month.

*****
NEW AMSAT BBS

AMSAT-North America has established a new dial-in BBS which will carry all Amsat bulletins, Keplerian elements, Space News and other items associated with the amateur space program. The Sysop for the new BBS is Mel Roman KA2UPD. It is presently on-line from noon-to-midnight weekdays Eastern Daylight Time and from 9:00 AM to midnight weekends. Mel says that he plans to become operational 24 hours a day very soon. Phone number is area code (201) 261-2780 and it accepts the usual 8-N-1 up to 2400 Baud. Other boards which presently carry AMSAT information are expected to continue to do so.

*****
HAM RADIO HORIZONS

How many of you remember the name Ham Radio Horizons? In the 1970's it was the name of a popular amateur radio entry level magazine. Now that name has been resurrected as the title of the latest Amateur Radio entry level video from Emmy Award winning Producer Rich Moseson NW2L of CQ Productions.
Unlike the rest of the CQ video series, Ham Radio Horizons is not a 'how to operate' program. Rather it is a 50 minute overview of every aspect of the hobby service prepared for the non-ham who may never even heard of Amateur Radio. Included is an explanation of exactly who we hams are, what we do with our radios, the role played by educators, youngsters and retirees, and much more. Moseson even goes so far as to show you the way that the FCC processes a license at its Gettysburg, Pennsylvania facility. In short, Ham Radio Horizons picks up where promotional video's such as the ARRL's New World of Amateur Radio leaves off. This, by providing the viewer and prospective ham with a concise explanation of almost every aspect of Amateur Radio on both a technical and humanistic level. For more information on Ham Radio Horizons the video and its companion book please write to CQ Video Productions, 76 North Broadway, Hicksville, NY 11801.

[827]

STONER SUES CONDO ASSOCIATION OVER ANTENNA RESTRICTIONS

National Amateur Radio Association President Donald Stoner, W6TNS has filed a major lawsuit against the against the owners association of his Clearwater, Florida winter home. According to court documents, Stoner indicated that he had struck a deal with the previous owner of the penthouse condominium for him to negotiate rooftop antenna rights as a condition of purchase. Stoner says that his repeated requests to the owners were ignored by that group which said it would not talk about the issue until W6TNS became a property owner. Later, the same owners association went as far as to pass a retroactive rule barring all antennas from the property and to this day refuses to even talk with Stoner about the issue.

"Originally the restriction was solely on television antennas. I couldn't care less about having a television antenna or dish, but I sure wanted a ham antenna. For two years they have been precluding me from having that and even have changed the rules retroactively to include ham antennas." stated Stoner.

As a result, the national society leader has gone to court. He is seeking injunctive relief to install his amateur radio antenna system atop the high-rise building. He also wants punitive damages from the association and its individual board members. This looks to be a precedent setting case in that it challenges restrictive covenants that were enacted after an antenna installation request was made by a ham. Newsline will keep you posted on the issue as it proceeds through the legal system.

*****
NEW YORK CITY BANS TAXI HAMS

The New York City Taxi and Limousine Commission has acted to ban the city's taxi fleets from using Amateur Radio as a method of communications. The decision of the Commission bars the permanent installation of any type of two-way Amateur Radio transceiver or ham radio accessories in a New York City Medallion taxicab. It also prohibits taxi drivers from utilizing ham radio as a method of communications between their dispatchers and base locations.
The action by the commission has the strong support of the city's amateur repeater owners, trustees and licensees. It also appears to be a direct response to a bid by a trio of New York City hackies who wanted to see every cab in the New York City

area equipped with ham radio.

*****
SAREX TO LAUNCH

The next Space Shuttle launch carrying the Shuttle Amateur Radio EXperiment is scheduled for June 20 at 13:38 UTC. The crew includes Pilot Brian Duffy, N5WQW, and Mission Specialist Janice Voss, whose license is pending. The flight was rescheduled from June 3.
As part of its primary mission, the Shuttle Endeavour will carry the SPACELAB payload, a laboratory which is leased by various industry to expand research in commercial microgravity development opportunities. The crew will also retrieve the European Retrievable Carrier satellite. Eureca as the satellite is known, has been collecting science since it was deployed from Shuttle Atlantis on the STS-46 mission in August 1992.
During the 7 day flight, Duffy will use 2 meter FM voice and packet. He will use his own call signs for voice contacts. The primary packet call sign will be W5RRR-1. The astronauts have pre-scheduled numerous contacts with schools and their assisting radio clubs in the United States and Mexico.
As for open contacts with he world's ham populace? That will be catch - catch - can. The attitude and elevation of the spacecraft are expected to change significantly during the EURECA rendezvous and retrieval on flight day 4. As a result, amateurs attempting to make a random contact or eavesdrop should update their Keplerian elements regularly throughout the mission.

*****
NO VOSS TICKET

Also, it also appears that Astronaut Janice Voss will not have her ham radio call sign by the June 20th lift-off of STS-57. According to sources at AMSAT, the supervising VEC did get her Form 610 application and tried to push it through. But word is that there was just not enough time to complete the needed process with FCC. Every ham application must be key-stroked into the Gettysburg computer and then sent by modem to Washington for comparison with the FCC database. This process takes a minimum of two weeks.

*****
JIM RAFFERTY - N6RJ S.K.

Noted DXer Jim Rafferty N6RJ, passed away on June 13 after a long illness. Rafferty, 44, was best known in DX circles for his work as a member of the ARRL's DX Advisory Committee, his development of the popular "N6RJ 2nd Op" DX operating aid, his numerous DXedition operations, contest operations from the Cayman Islands and other Caribbean islands and the countless forums he has moderated over the years. Rafferty was employed by Ham Radio

Outlet Inc. where he served as the corporations Vice President and as manager of the chain's Anaheim California store. N6RJ was recently honored as the first recipient of the newly created "Spirit of DXing" award created by the Southern California DX Club and presented to him on April 17 by his longtime friend Chip Margelli K7JA at the 1993 International DX Convention in Visalia, California. Services were scheduled Friday June 18th at St. Martins Church in Yorba Linda, California.

*****
FIELD DAY SATELLITE OPERATIONS

The Fuji-OSCAR 20 satellite will operate its Mode JA analog transponder for use during Field Day. This special transponder operation is the result of discussions between the Japan Amateur Radio League and the ARRL. OSCAR 20 normally operates its analog transponder on Wednesdays only. According to Fujio Yamashita, JS1UKR, of the JARL, Fuji's digital transponder and packet BBS will shut down at 09:20 UTC on June 25th. The Mode JA analog transponder will be activated at this time and will remain available until 10:20 UTC on June the 28th.
The analog transponder will then be available for SSB and CW communications only. Uplink passband is 145.900 to 146.000 MHz. Fuji's downlink passband is 435.900 to 435.800 MHz and is inverting.

*****
VOYAGERS REACHES EDGE OF SOLAR SYSTEM

NASA's Voyager 1 and Voyager 2 spacecraft are sending back what scientists believe is the first direct evidence of the boundary between Earth's solar system and interstellar space. Scientists say that the unmanned probes are recording intense low-frequency radio emissions from beyond the solar system. Those signals combined with other data collected by the Voyagers indicate the edge of the solar system. According to researcher Don Gurnett of the University of Iowa, this type of radio signal occurs when a cloud of electrically charged gas expands from the sun and reacts with cold gases between solar systems. These cold interstellar gases are beyond the outermost limit of the sun's magnetic field and mark the edge of the solar system.

*****
DAYTON AMATEUR RADIO ASSOCIATION LAUNCHES BALLOON

The Dayton Amateur Radio association has announced plans to loft another high altitude weather balloon carrying an ATV transmitter on 439.250 MHz and a two meter simplex repeater on 144.340 Mhz. The flight is slated for Saturday June 26th at 08:00 Eastern Daylight Time from the Radiosonde Launch Site in nearby Huber Heights, Ohio. The ATV system will feature a panoramic rotating mirror and altitude and temperature sensor

sending on-screen digital telemetry.

*****
ARRL ATLANTIC DIVISION AWARDS FOR 1993

The ARRL Atlantic Division "Amateur of the Year" for 1993 is Tony Young, WA3YLO, of Bowie, Maryland. Young is president of the Foundation for Amateur Radio, a consortium of radio clubs in the Baltimore, D.C. area that administers an extensive program of scholarships for licensed amateurs.
Recipient of the Atlantic Division's "Grand Ole Ham" award is Jim Spencer, W3BBB, of Lansdale, Pennsylvania. Among his accomplishments, Spencer designed and built the Amateur Radio display station at the Franklin Institute Science Museum in Philadelphia that was pictured on the cover of the July 1992 QST magazine.
The Atlantic Division's Technical Achievement award went to John Hansen, WA0PTV, of Fredonia, New York, an assistant editor of the AMSAT Journal and the designer of several innovative systems for amateur satellites.
These awards were presented at the Atlantic Division Convention in conjunction with the Rochester Hamfest in May.

*****
LAST CALL FOR YOUNG HAM OF THE YEAR AWARD NOMINATIONS

This is the last call for nominations for the 1993 Westlink Report Young Ham of the Year Award. The award be presented at the Huntsville Hamfest and ARRL National Convention in Huntsville, Alabama the weekend of August 14th and 15th.
The Westlink Report Young Ham of the Year is a person who in the view of the judges best epitomizes the accomplishments of youth in amateur radio. Achievements can be in any area of endeavour associated to the hobby service. To qualify, a nominee must be 18 years of age or younger, be attending an accredited school or place of learning and must hold any class of valid United States amateur license. Cutoff date for nominations is June 30th. If you have already sent for a nominating form and have not yet sent it back, please do so now. For those who need a nominating form please send an S.A.S.E. to the 1993 Westlink Report Young Ham of the Year, 28197 Robin Avenue, Saugus, CA 91350.

*****
NO MORE RFI IN SOUTHERN CALIFORNIA

This from the CGC Communicator newsletter, a broadcast industry trade publication. It says that back on March 21, radio station XHTIM in Tijuana, Mexico switched frequency from 91.5 to 91.7 Mhz, increased its' power and ended fourteen months of interference to KUSC-FM in Los Angeles. Three weeks later, KUSC moved to Mt. Harvard and commenced operation with a new, high

power directional antenna. And you think you have problems with
interference to your two meter repeater?

New version of MorseTrainer (1.0.2) for Macintosh computers

Availability:
via anonymous ftp:130.235.32.86

MorseTrainer is a powerful tool for learning and training Morse code.

Features

* Three different training modes: user text, random text, library text
* Arbitrary signal pitch and timbre
* Arbitrary speed and tempo
* Multi-alphabet support
* Random text generator
* Text library editor
* On-line alphabet
* On-line manual
* Help Balloons
* And a lot more!

And of course, it's FREEWARE!

4074. Kenwood TM-742A/942A DTMF remote control

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-23 14:29:28 UTC
From: gobbel@cogsci.ucsd.edu
Message-ID: <GOBBEL.93Jun23142928@cogsci.ucsd.edu>
Source record: 280070

Yes, it can be controlled remotely. Here's what Kenwood sent me after I called up and asked. What they don't make clear is that when the unit is in *microphone* remote control mode, any tones heard through the mic will also control the radio, including what comes through the speaker! That mode allows you to do more than the limited "official" DTMF remote control--things like adjusting the squelch, for instance. Also, note that once you've given the access code, there is no access control other than PL tones, until you turn off remote control by sending A#. This also means that you need to be very careful with the mic when it's controlling the radio, because I've found that it's very liberal about what it interprets as a DTMF tone, including such things as white noise, road noise, and the clunks and bangs of hanging up the mic.

The remote mode described below is essentially identical to that for the 732A.

A setup that I've found works very nicely is to run crossband repeat between 220 and 2 meter, and control through 440 simplex. Lets me use my HT on 220, with no control signals on the talk channel. Cool!

73,
-Randy, KD6ULI

TM-942A, TM-742A
REMOTE CONTROL BY EXTERNAL DTMF SIGNAL, Instruction Manual Addendum

This transceiver can be remote-controlled by any other transceiver which can transmit DTMF tones. This instruction is similar to Remote Control by DTMF Microphone, page 61

FUNCTION SELECTION

1. Select a common band for the TM-742A/942A and the remote control transceiver, and enter the same frequency on both transceivers. Enter a 3 digit DTSS code (xxx) on the TM-742A/942A (Refer to Note 2.) The DTSS icon must be displayed. (See DTSS code selection, pages 72 through 75.)

2. Press the Band Sel key (push the volume control) to select the band to be controlled. DTSS should be turned off on this band.

Repeater Mode: If you intend to operate the transceiver in the Repeater mode, review Instruction Manual pages 59 & 60, Operation as a Repeater, for an explanation of Fixed Band and Cross Band Repeater modes. This is not a 100% duty cycle transmitter. Before selecting the Remote Control mode, set the transmitter output power to Low or Medium, and set the

Time-Out-Timer (page 32) at three (3) minutes.

3. Press the RC key on the transceiver. The RC and DTSS icons will flash.

OPERATION

1. Be sure the frequency for the remote transceiver is the same as the TM-742A/942A, and that the remote transceiver's DTSS (if so equipped) is off.

2. Control mode initialize. Place the remote transceiver in transmit, and send "A" (fourth column key, not alphabet) followed by the correct 3 digit DTSS code (xxx), then "#". Each key press and space must be less than 1 second each. Using DTMF memory will be the most convenient method to send this control string. (Two or three attempts may be required.)

3. On the transceiver under remote control, the DTSS icon will display steadily, and the RC icon will continue to flash. The transceiver is now ready to accept external DTMF Remote Control.

FUNCTIONS WHICH CAN BE CONTROLLED BY THE REMOTE TRANSCEIVER

Function DTMF keys (Notes)

CALL CH. mode ON 7
CALL CH. mode OFF 8
(Return to VFO mode)

Control mode initialize A, xxx, #
Control mode exit A, #

CTCSS ON 3
CTCSS OFF 6

Frequency entry A, 0-9
(In VFO mode. Use numeric keys)

MR mode ON 9
MR mode ch no. select A, xx
(In MR mode. Use numeric keys)
MR mode OFF 8
(Return to VFO mode)

T.ALT ON 1
T.ALT OFF 4

Tone Freq. Sel B, A, xx
(xx=2 digit tone ch. no 0138)
Tone ON 2
Tone OFF 5

TX power (H=no letter, M, L) 0

UP (freq, tone or MCH) #
Down (freq, tone or MCH) *

VFO mode 8

X-Band Repeat ON C, A, #
(& then exit Control mode)
X-Band Repeat OFF A, xxx, #, D
(Restart Control mode initialize)

Notes

1. To set the memory channels or tone frequency channels, select the mode, then input the channel number using the numeric keys. For the tone freq. channel numbers, please see page 70. (The UP or DOWN buttons may also be used to increment or decrement channels or VFO frequency, but no acknowledge or feedback is provided.)

2. It is presently not legal to transmit control codes below 222MHz. Since it is illegal to transmit control tones (DTMF) on the 2m band, you must enter a 3 digit DTSS code (xxx) on the 440MHz band. The DTSS icon must be displayed on the 440MHz band.

3. The microphone, and the mic element, are always on, including in the RC mode. DTMF tones from the transceiver's speaker, or from a telephone with speaker, may "take control" of the radio, just as pressing a DTMF button on the microphone. It is not advisable to leave the radio unattended in the RC mode.

4. There is one function which is not supported and cannot be recovered by the remote transceiver: RC cancel, go to the Intercom mode. Press A, B. This is one-way & must be reset with transceiver RC button!

4075. 6m work

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-23 15:02:00 UTC
From: stocker@nssdca.gsfc.nasa.gov
Message-ID: <23JUN199311022545@nssdca.gsfc.nasa.gov>
Source record: 280040

Have to confess that the recent discussions on 6m use, opportunities and problems have really peaked my interest in this band. The FAQ was very useful and informative.

However, I would like some personal insights in the opportunties and frustrations in taking advantage of the "hf-likeness" of this VHF band. Also, any advice on the best way to get equipment to try out the band without plunking down a bunch of money. Lastly, any info that people would care to pass on personal experience with antennas for the band especially good luck with homebrew or less expensive antennas.

Thanks for any information you might be able to send me.

4076. Re: 5A0RR Operating Practices

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-23 15:03:42 UTC
From: wb9tow@bluegrass.ecn.purdue.edu
Message-ID: <C92xu7.L2q@noose.ecn.purdue.edu>
Source record: 280041

Yes Alan, I feel you are right referring to Romeo's
operating practices, But first, several prominent Dxers
discussed this matter with him at Dayton, he acknowledged
them with "yes, yes"...but I think it is only fair
to give the guy the benifit of the doubt. He has limited
understanding of English. Often in communication, an individual
will state "yes" and not be in total understanding of the
topic at hand. I am sure that several, Ed NT2X, Ed W2MIG,
Joe K8JP and other noted present day known Dxers
will provide the necessary feedback to Romeo and he will
get better...afterall, OH2BH has been dxing for many years,
you cant expect Romeo to display the abilities of one with 30+
years of Dxpeding??? Reguardless, I DO agree with
you...he will learn.let's hope that it is soon!
Another note...the person in the country you need is in control..
if you want the dx..you must do what he says to do..oh well..
vri 73 es gud dx...steve

4077. Re: Ground Rods In Concrete

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-23 15:14:14 UTC
From: gary@ke4zv.uucp
Message-ID: <1993Jun23.151414.1941@ke4zv.uucp>

In article <57684.match@sky.civil.utah.edu> <match@sky.civil.utah.edu> writes:
>>In article <C8zqDH.3In@news.claremont.edu> aross@jarthur.claremont.edu (Andrew M. Ross) writes:
>>>
>>>Putting ground rods through or into concrete is a Bad Thing. I've heard
>>>stories about concrete slabs (usually tower bases) that exploded when
>>>lightning hit.
>>
>>This is an old wives' tale Andrew.
>
>You are wrong Gary. My brother bought a house that had a concrete pad
>with a 4" pipe sticking up out of it. Originally it was installed to
>mount the dish for a TVRO reciever, that the previous owner took with
>him. He (my brother) decided that this 4" pipe was a perfect thing to
>mount his CB vetical, so he dropped a another pipe into this one, (it
>dropped in six feet) went up 30 feet and installed his vertical.
>
>About a month ago he incured a direct lightning hit to the vertical.
>The concrete exploded! Great chunks of concrete flew over the top of
>his roof and landed in the street. It cracked his swimming pool. It
>melted his pipe/tower in half. It cracked the foundation on his house
>and on his neighbors house, and blew out his elctrical distribution
>panel, damaged most of the electrical appliances in the house including
>his dishwasher and garbage disposal, even though these were obviously
>grounded. Looks to me that the path was through the tower to the concrete
>base, through the ground and into the house wiring VIA its grounding!
>(before someone flames me, the current actually flows from the earth
>to the sky in a lightning strike, but we observe it as though it's the
>other way 'round)

Strikes have been monitored with both polarities. However, every circuit must be complete. Analysis of current flows in this case would require much more detail information, current can flow to ground, through ground, from ground, through equipment grounds, and back to ground. But, details count, this can only happen if there are substantial resistance differences in various parts of "ground". These are often called "ground loops" and can be the very devil to deal with. And it's why I always recommend single point ground connections.

>As you have pointed out elsewhere, when concrete cures, there is alot

>>concrete. Only in cases where there are *no* conductors embedded in
>>the concrete can the resistance to the surge be high enough to cause
>>heating that will "explode" the concrete.
>
>Wrong again. Think about it. 10,000-100,000,000 amps through a 1-5 ohm
>resistor is going to have to dissipate one heck of alot of power. It does
>this in the concrete base by making steam. Also, even a relatively small
>conductor (small like a 1/2" rebar) will conduct all this current until
>it melts in two, and by then the surrounding air is ionised enough to
>sustain the discharge.

Yes, lets think about this. Lightning strikes have been recorded with
current flows of 18,000 amperes. Rare "superbolts" have been observed
that exceed this value by some unknown amount, but they are extremely
rare. Now lightning can be viewed as a *constant current source* for
analysis of effects on a ground system. A good Ufer ground will have
less than 1 ohm resistance to ground. So, assuming a bolt current
of 20,000 amperes and a ground resistance of 1 ohm for ease of
calculation, the peak power dissipated by the Ufer ground is
P=I^2*R=2e4^2*1=400 Megawatts. That seems like a lot, but that's
peak pulse power, not deposited energy.

The duration of the typical lightning bolt is 200 microseconds.
So to get deposited energy, that's what melts things and boils water,
we multiply peak power by 2E-8 and divide by 3600 which gives 22.22
watt-hrs of energy, or 75 BTU in this case. That's less energy than
the typical lightbulb consumes, and won't boil much water, it'll raise
the temperature of one pound of water 75 degrees F. Certainly not enough
to rupture 3000 PSI concrete or hurl large chunks over a house.

Obviously there's something wrong with this analysis. And that something
is the 1 ohm to ground resistance of the mast "stuck" in a 6 foot pipe
in concrete. Let's make it 10,000 ohms in the corroded mast to pipe
junction, and another 2000 ohms in the short pipe in concrete interface,
and another 500 ohms in the concrete to soil interface since it's area
is relatively small. Now, with 12,500 ohms let's rework our analysis.
Our 400 MW peak becomes 5,000,000 MW, and our deposited energy becomes
277.75 kW, or 947,683 BTU. Ouch! That can boil some water! As usual,
the devil is in the details. This isn't a Ufer ground, so we shouldn't
expect it to perform like one.

>You could maybe disribute the load by parralleling a bunch of ground
>connections, but if you observe lightning paths, you'll see that even
>when several paths to ground exist the discharge will prefer ONE, seemingly
>for no aparent reason, so you still loose.

Lightning is not some mysterious force, it has to follow Kirchhoff's Laws just like any other electric current. The current flowing from a node divides among the various branches in inverse proportion to the resistance of each branch. (Actually, I should be saying *impedance* rather than resistance throughout this note since a lightning pulse must be analyzed by AC methods. It can be modelled as a halfwave of a squarewave for simplicity, or more accurately as a damped sharp risetime pulse.)

>Gary, working in destructive testing you should know better. I'm not
>saying that conductors placed in concrete are not good electrical
>grounds, you're very correct on that point. Ufer grounds are excellent,
>but remember they're intended to prevent relatively small discharges
>from setting off bombs, not to dissipate a lightning strike. I've seen
>this exploding concrete thing and I'm a believer!!

Marvin, Ufer grounds are Code accepted for lightning protection. They aren't just for static dissipation. However, the difference between a safe ground system and an attractive nuisance for lightning is in the details of the installation. One of the services I offer is ground system testing.

Let's go back and analyze an 8 foot ground rod installed in a 6 inch concrete floor. The Code says a "made" ground should present less than 25 ohms resistance to earth. That gives a deposited energy of 555 watt-hr for our lightning bolt. Of that, the concrete gets 1/16th (roughly), so it will see 118 BTU of heat. That will raise the temperature of the 15 pounds of hydrated concrete immediately adjacent to the rod by 7.86 degrees F. No explosion.

It should be obvious by now that since lightning can be considered a constant current source, things you do to reduce resistance to ground will reduce the amount of deposited energy in the paths to ground.

Gary

USED HF/6m RIG PRICE SURVEY
23 June 1993 Version

I have absolutely no affiliation with any ham-radio-related business. Rigs are sorted by maker, model, and price. All transactions were made within the past three years. I welcome any additional responses; please indicate maker and model of your used rig, date bought/sold, how sold (Usenet, retailer, on air, private, etc.), price, condition, and any accessories or options.

They could always sue. There's a comment period on almost all Commission actions, and they could file a claim that the use of the call would cause confusion among the audience. And if that failed, they could try the courts on trademark grounds. CBS successfully sued the Columbia Broadcasting School to prevent them from using that name since it caused the false conclusion in applicants' minds that the school was related to CBS in some way.

I downloaded via Fetch the file MorseTrainer-US-1.0.2.sit.hqx but
can not get it to run. What type of file is it? The documentation file
found in the pub directory suggested it was a hypercard stack, so
I downloaded it as a binary file, set file type and creator as 'STAK'
and 'WILD' but hypercard said it was not a hypercard stack. Any
suggestions?

4081. Which Rig To Buy?

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-23 16:09:32 UTC
From: HunterR@montageski.ksc.nasa.gov
Message-ID: <1993Jun23.110932.6637@titan.ksc.nasa.gov>
Source record: 280043

I am looking for opinions on the Yaesu 1000 or 1000D versus the Kenwood TS-950SDX. Other comments are also welcomed!

I'm sure there are plans for other new rigs with DSP (digital signal processing) but does anyone have any insight as to when they might hit the market and what features they might employ?

Thanks in advance.....Randy WB8ZAL - KSC, Florida

4082. Measuring SWR (was: Re: Midland Power-Max Dual Band Antenna)

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-23 16:54:29 UTC
From: markm@bigfoot.sps.mot.com
Message-ID: <1993Jun23.165429.17610@newsgate.sps.mot.com>
Source record: 280051

In article <C92sLL.89F@feenix.metronet.com> marcbg@feenix.metronet.com (Marc Grant) writes:

>
> If there's any way of measuring it at the antenna, you may want to look
> and see what it reads.
> ...

Now I don't want to start a flame war here, but having just read Maxwell's book 'Reflections' I can't resist a comment.

Maxwell goes to great lengths to debunk the myth that SWR varies along a feedline. It sometimes appears to do so but that is caused by RF flowing on the shield of the cable causing an erroneous reading on the SWR meter and giving the appearance of a variation along the line (which could very well be the cause of the apparent high SWR in this case). So, there's no need to measure it at the antenna. I'm not sure you would get a valid measurment anyway.

However, Maxwell also points out a high SWR reading is not necessarily a Bad Thing and so what Marc says about the performance of the rig being the best indicator is probably true.

While I'm on the soap box, a friend of mine has a Midland dual-bander (I don't know which one) and is happy with its perfomance. I doubt that he has ever measured the SWR, tho. I know others who are happy with other glass mounts also (esp the Larsen dual-band model). As for me, I punched a hole in the top of my brand new truck (much to my wife's chagrin) and snapped in an NMO mount. I use a Diamond dual-bander and it works very well also. Come to think of it, tho, I've never measured the SWR either :-).

BTW, 'Reflections' is a great book. I strongly reccommend it for a good presentation of antenna/feedline theory. You don't have to be a EE to understand it, either (some vector math comes in handy, tho).

I am looking for a mail-order source for Motorola Radius
HTs (specifically P50 and P110 models) or equivalent types from
GE, etc. Can anyone recommend any outfit and/or give me going
prices for VHF models?

Requirements are: 2W, 2Ch minimum, PLs must be changeable
in the field. Ruggedness counts. Ideal price (well, is $5, but
realistically) is less than $350.

Thanks in advance and happy Field Day, de N6XHW
D. Reeves

4087. alphanumeric pager software question

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-23 17:58:55 UTC
From: chinatti@phoenix.Princeton.EDU
Message-ID: <1993Jun23.175855.24085@Princeton.EDU>
Source record: 280056

I have a question about the software that is available from some paging companies for sending messages to alphanumeric display pagers. A friend of mine has an alphanumeric display pager and was given software that allows him to enter a message for his pager, then the software connects with the paging computer (over a modem) and sends the message. I believe that this is a fairly standard system, since the software he has works with 2 different local paging companies. My question is does anyone have any information on the protocol for the communication between the two computers? The reason I am asking is because the software is for an IBM PC and he would like to write his own code for a different type of computer (for which software is not available) to connect and send a message. I am sure that it can't be too difficult, but merely a matter of figuring out what to send and what kind of acknowledgement to wait for. Does anyone else have any experience with this? If not, I guess I will have to figure out a way to "watch" the serial port during a few message transmissions and decode it myself.

Thanks,
Steve

PS - the pager is a Motorola Advisor if that makes any difference.

Line loss will definitely make the SWR reading vary along the line.
It tends to make the SWR look better than it is at the antenna
because the reflected power is being dissipated in the line.
Hopefully, this is not a big deal in a mobile installation with
short line lengths.

Maxwell often assumes that you have a conjugate match at the transmitter
end, which is not likely with a typical VHF/UHF transceiver.

> BTW, 'Reflections' is a great book. I strongly reccommend it for a good

I thought the book was good, too. But just be wary of the conjugate
match assumption.

Hi,

I am posting this message for a friend who needs to build a biotelemetry system
for a research project. The system will collect physiological measurements
(blood pressure, body temperature, etc) from small animals via
radio-frequency (RF) link.

We would greatly appreciate it if someone can provide the following
information:

1) Name and phone number of suppliers for components such as
biosensors and RF transmitters.
2) Good journals or books on the implementation of such system.
3) Suggestions and recommendations from people who have experience
in constructing such system.

What? It was grounded by virtue of the fact that it was planted firmly
in the ground, with a yard or two of concrete! Nothing was connected to
anything else, as this antenna sat unused for the last 3 years or so.

As an aside, Do you remember when the Soviets had the first spacewalk outside of a capsule? I can't remember the year but I do recall seeing magazine articles showing that it was faked. Detailed analysis of the video and still frames supposedly showed wires supporting the cosmonaut "floating" in space. Whether it was really faked or not I can't say.

Can anyone provide additional details?

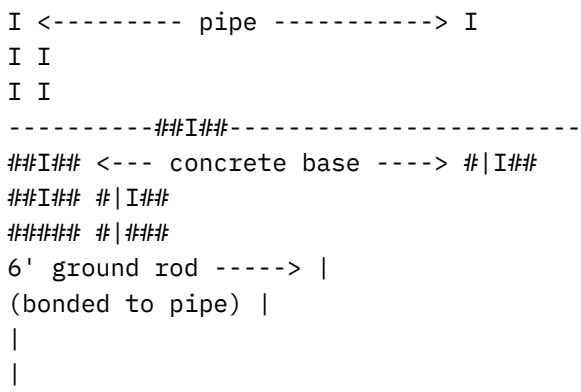
That was my first thought.. I *DO NOT* consider a piece of pipe
planted in foot or two of concrete to be "grounded".

Now, if it had a 6 foot ground rod bonded to it that continued on through
the bottom of the concrete base... well that's different.



The pipe on the left is NOT grounded. The one on the right is.
Now, is the one on the right "sufficiently" grounded ???

Let's find out what we are talking about here.

|> Hopefully, this is not a big deal in a mobile installation with
|> short line lengths.
|>

Remember that SWR stands for "Standing Wave Ratio", which is the ratio of Vmax to Vmin along the transmission line; the notion of SWR at a "point" on the line is meaningless. Line loss has the effect of making the reflection coefficient (usually called "gamma" in the EE texts) decrease in magnitude; as it decreases, what you measure as SWR decreases and the transmission line appears to have a better match. For Smith Chart junkies, this means that the little vector which whirls around has a decreasing length with distance traveled toward the generator and begins to spiral in to the center of the chart.

|> > However, Maxwell also points out a high SWR reading is not necessarily a
|> > Bad Thing and so what Marc says about the performance of the rig being the
|> > best indicator is probably true.
|> >

All the power you put into the transmission line goes somewhere: it either gets radiated (good) or dissipated (bad) in line loss. High SWR is usually only a problem at HF if you end up with a voltage loop (maximum) at the transmitter; the blue glow from the capacitor plates arcing is the tip-off.

I finally got smart and bought a nice R-X noise bridge from Palomar. Unlike the SWR meter, it really tells you what is going on. A great gadget...every antenna junkie should own one. Too bad it only works well up to 30 MHz.

Gary:

Per 47CFR73.3550(n):.......the applicant must obtain and submit with the
application for the callsign the written consent of the licensee(s) of
such station(s).

In other words, if you wanted KCBS-TV, and it was not assigned, but there
was a KCBS assigned, you would need their authorization in writing. You
are correct in your information, of course, but in reality I would not
count on such an authorization, or wish to pay the bill if it indeed was
so authorized!

4101. Using square wave power

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-23 21:28:03 UTC
From: dale@sequent.com
Message-ID: <1993Jun23.212803.3706@sequent.com>
Source record: 280071

We are considering using a small inverter (200 watt) which
produces a square wave to power a small printer and a
Kenwood SM230 scope. The printer uses about 30 watts when
printing, less on "standby", and the SM230 scope uses 29 watts.

We were thinking of the "Tripp-lite PV200" inverter which will
support 200 watts continuous duty, so we are well within the
wattage limit. The inverter output is "Squre wave output voltage
varies directly with input voltage, and is inversely proportional
to load". (This from spec sheet.)

Plan is that we have generator powering battery charger, which
keeps a 12 volt deep discharge battery charged. Some 12 volt
powered gear hangs on that, along with the inverter. That
powers the small printer and SM230. When the generator is
down for refueling the printer and scope continue to run.

Question is: Will there be any problems running the printer
and scope for 24 hours from a square wave power source?
I am most concerned about the Kenwood SM230 station monitor.

I do realize that there are other options -- shutting down the
110V stuff, spending lots of $$ on a really great inverter
that generates a sine wave, and running QRP. The question is
will, the power from this inexpensive inverter damage the
equipment?

Thanks, 73, and good luck on Field Day. This event is turning
out to be a great simulation of an emergency in which 3 people
spend 3 weeks preparing, and can haul about 3 car loads
of tents, fuel, food, and thousands of dollars of electronics
equipment to a mountain top.

If you're interested in DSP, then you can forget the Yaesu 1000D -
it doesn't have any. You choices are the TS950SDX and the
Ten Tec Omni-VI.

The external DSP boxes (which work at the audio passband) are actually
quite good - and work with any radio.

My best suggestion, for the most features, in a small package, at the
price range you mentioned, would be the Radio Shack htx202. Good radio,
the BEST intermod protection available, and has been known, (lately) to
go on sale for 199.00

I do not work for Radio Shack, nor do I want to. The radio just happens
to be a excellent deal for the price!

I have one copy of a Heathkit condensed manual titled "Assembly and Operation of the HEATHKIT SSB TRANSCEIVER Model SSB-101". Its yours if you send me a self addressed 8" x 12 " envelope with sufficient US postage for sixteen ounces from: California to your location.

The intent is to send this manual to someone who ACTUALLY has this Transceiver.

We no longer have this transceiver.

First come first serve. The first person to send me e-mail is the winner. Then you have five calendar days from the time and date of your e-mail to claim the manual. That means I must receive your self-addressed envelope within five calendar days. After that, it goes to the next taker.

Steve-

After reading your posting, I tried downloading the file, also using Fetch. Normally, fetch looks at the suffix (.hqx in this case), and uses that to determine whether binary or ascii (text) transfer methods should be used. Fetch also can do the .hqx conversion "on the fly", producing either a running program or, as in this case, a file requiring further processing (unstuffing).

However, the copy of MorseTrainer-US-1.0.2.sit.hqx on the specified machine, was apparently uploaded using unnecessary MacBinary conversion. Therefore, my Fetch recognized it as a "MacBinary II" file, and downloaded it as binary, making the MacBinary conversion during download. I then used Stuffit Deluxe's hqx translation utility to convert the downloaded .hqx file, which became a "stuffed" (.sit) file. When Stuffit was used to un-stuff that, the result was a folder containing several files, including the main program, which ran successfully.

After I had downloaded the file using Fetch's automatic method, I went back and repeated the download, except forcing the transfer method to be ascii. This time, Fetch correctly performed the .hqx translation during the download. Stuffit had no problem unstuffing the resulting .sit file.

If you don't have much experience downloading files via ftp, the steps outlined above may be more confusing than helpful. Normally, you won't encounter files like this one. However, you must learn to recognize the various filename suffixes, in order to use the matching method of translating them back to their original format.

A few common examples:

.hqx files are hex-encoded using a Macintosh program, BinHex version 4 (NOT 5). They are normally transfered using ASCII (text) methods. When they are relatively small, they may be pasted into an E-mail message.

.uu ("UNIX-to-UNIX") files are similar to .hqx, except the method was originated on UNIX. Translation programs are available on other systems, including Macintosh.

.tar files are created using a UNIX method, called "Tape Archive". Again, translation programs are available for other systems. They are transfered using Binary methods.

.Z files are created using a UNIX method, called "Compress". Again, translation programs are available for other systems, and the compressed files are transfered using Binary methods.

.sit files are created using a Macintosh program, Stuffit. The stuffed files are transfered using Binary methods. I have seen an unstuffing program for use on an MS-DOS machine.

.arc and .zip are two of the common methods of compressing files on MS-DOS machines. They are transfered using Binary, and translation programs are available for other systems.

I realize this is probably more than you really wanted! However, this represents information that took me a lot of trial-and-error effort to acquire. I hope you, or other readers, can benefit.

In an ongoing thread on "rec.radio.swap" regarding some potentially stolen rigs, gws@n8emr.cmhnet.org (Gary Sanders) writes:

> Big test for stolen gear would be manuals...

I purchased a radio recently through "rec.radio.swap" that claimed to be an evaluation rig two weeks out of the box that was being sold because another rig fit had been determined to fit the application better. It wasn't until a few days after taking delivery on this radio that I realized (1) the manual was an extremely crude photocopy, and (2) the warrantee card was missing. Apart from that, everything was normal; the rig worked fine, it came in the original manufacturer's packaging, all the accessories were present, etc.

My first thought was that this was probably gray market goods smuggled into the country, and had originally contained a warrantee and documentation in Japanese. I guess, however, that it might also be hot.

What would you do under these circumstances?

Hi,
I have a CP-1 and wrote software for it on an old CPM system, I've seen ads in QST for software that uses a multi-sampling technique to increase the signal/noise ratio, but I think the software was for IBMs.

The tricky thing was making the computer generate wierd baud rates (60 WPM is 45.x baud). If your computer's baud rate is changed by a large number like 20100, 10050, 5025... then you can calculate the baud rate and you are in luck. If the chip is "smarter" and uses 10 for 19200 baud, 9 for 9600 baud etc, you will have to add a seperate baud rate divider (like I did) or just poll the UART status lines in software (much trickier).
The ARRL handbook had a good listing of BAUDOT and AMTOR codes for converting to ASCII.

: <faunt@netcom.com>

The STS-57 shuttle contact was repeated on several local frequencies. We could hear the tele-conference discussions taking place. The two students that communicated with the shuttle were able to do so through a gateway station in Hawaii. The shuttle antenna was in the south facing window. When the southern California gateway station tried to communicate with the shuttle, it was clearly doomed as the shuttle antenna was on the wrong side of the craft. It is hoped that further communications will take place Saturday. Good luck on Field Day!

Having purchased a fair amount of used equipment (actually never purchased
a new rig), I think the above test for stolen equipment is poor at best.
Otherwise a lot of the gear at hamfests, listed on the usenet, and sold
through the Yellow Sheets is stolen based up on that test. Probably 1/4 to
1/3 of the rigs I've purchased didn't have manuals. Also, being one that
is notorious about losing things (especially manuals), I'm a little
sensitive to people suggesting that because I lost a manual I must be
selling a stolen radio. Stop playing policeman.

Doesn't the ARRL keep a Stolen Equipment Register, like the Australian WIA does? The register is published from time to time in the national journal "Amateur Radio", and new entries appear on the regular broadcasts.

I know of someone who had just bought a load of gear from someone, and upon hearing the description on the broadcast that day, his heart sank... He went straight to the police, and eventually he got his money back, the real owner got his equipment back, and everybody was happy except for the thief.

It certainly is, I often use Teflon myself, to get lower losses.
Cost isn't as much of a problem when you buy intelligently at
flea markets. (I'm assuming you have the skills to do so :-)).
The favorite of the old timers was polystyrene, except that it
melts and cracks very easily. Its probably not suitable for
indoor antennas, much less outdoor ones, due to mechanical
reasons.

>I've seen is to try it in the microwave oven. (PVC melts, microwave

>I use PVC as standoffs for a gamma rod that matches my tower on
>160 meters. It hasn't melted at legal limit power.

I measured one coil--14 turns of 2 inch .062 diameter wire, 1.8
inches long. Good old Miniductor? Q is pretty decent at 521
(7.9 MHz) Sticking in a long piece of 1.5 inch schedule 40 white
PVC tubing slit in half, the Q degrades to 503. Obviously, the
Q degradation would be worse if the wire were wound on a PVC
form. By contrast, a piece of half inch Teflon noticeably
detunes the circuit, requiring the HP Q meter to be retuned, but
the change in Q is negligible.

So, is this significant? Well, it depends on how high a Q you
really need. For someone designing a 10 kHz LC bandpass filter
for 80 meters, even the capacitor Q matters (high quality chip
capacitors do better than typical silver micas). On the other
hand, if you can tolerate the loss and it won't melt on you,
it might well make sense. For instance, there is a company
that will plate copper on large teflon tubing for you for that
Ideal helical antenna, but I'm pretty sure I couldn't
afford it.

H E L P !!!

I am a control operator for the 146.46 repeater in Princeton, NJ. We are looking for a weatherproof outdoor enclosure for our machine and controller.
It should have front and rear rack rails and should have the following dimensions (at the absolute outside!):

39 inches high
24 inches wide
42 inches deep

We suspect that we are going to have to find someone who makes such a box, but
so far we have come up empty using the usual suspects! Is there someone else
out there in repeater land who has run into this problem and found a good solution? Can you help us? Could you drop me a message or call and let me
know where we might find help? Thanks!!!

Let's go back a step

Someone said

C = Czar

and

T = Tsar

Now that's just too good not to keep in the list !

I also like pseudo- which adds the extra confusion as to whether it is
a prefix for whatever the next word is

How about U = uber (sorry, no umlauts on this keyboard)

and for the truely twisted minds Q = QSY

David (Guatamala Madagascar Zero One Two Three FOUR Zanzibar Nigaragua Xanadu)

The powers that be here are making the administrators of our news system start filtering everything that is no directly related to work so I would like to know if I can subscribe to this news group and any of the other groups related to ham radio. These new groups that just got started are nice and are very helpful (this is just let whoever know I like them).

Please reply to my email since I don't know when they will pull the plug.
Thanks

4129. ARRL Sections for Field Day

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-24 12:20:00 UTC
From: rcmcc@canis.bellcore.com
Message-ID: <1993Jun24.122000.27390@porthos.cc.bellcore.com>
Source record: 279954

I tried posting this yesterday morning,
but it seemed to end up in the bit bucket somewhere.

++++++++++++++++++++++++++++++

We've found the following cheat sheets
handy during Field Day.

1. ARRL Sections in prefix order.
2. ARRL Section abbreviations in alphabetic order.

And just to be complete (it's short).

3. ARRL Divisions and Sections.

Suggestions and corrections welcome.

Ron McConnell, w2iol, rcmcc@canis.bellcore.com

4130. Transverter help??????

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-24 12:21:50 UTC
From: MOWE%SLUMUS.BITNET@cunyvm.cuny.edu
Message-ID: <24JUN93.09033316.0012.MUSIC@SLUMUS>
Source record: 279949

The TS-400 lacks a low-power tranverter output, so you must
either make one or find a way to dump your power. The former is
preferred if you want to dedicate the rig to VHF. You just go
into the rig and find the jumper coax that carries RF from the
low-level RF board to the PA board; route it to the back of the rig.
You'll need to mount a BNC socket or something (what? Drill??).
You probably won't even need to turn off the finals because they're
not getting any drive anyway. The drawback to this is that the
rig can't be used for anything else (besides QRPppp) unless you
re-connect the coax jumper to its proper destination. I did this
with my '850 (who need HF anyway?). I get about 50 mw out.
A second alternative is to dump your 100 watts into a dummy load.
Use a teensy variable cap to steal 10mw. A Heath Cantenna is good
for this if you remove the DC-output wiring and connect the cap from the
load resistor to the RCA socket. The disadvantage to this idea is
obvious: you're wasting juice.

The 2E-8 is a typo, should be 2E-4. The answer's right though, I did
it on a calculator. :-)

PVC is somewhat more lossy than some other plastics. One test
I've seen is to try it in the microwave oven. PVC melts, microwave
safe plastic dishes don't. However, either will melt on a stove.
So the difference is at least partially due to the difference in
RF absorption. I'd imagine it's frequency dependent to a degree.
I use PVC as standoffs for a gamma rod that matches my tower on
160 meters. It hasn't melted at legal limit power.

>
>Therefore, with cable coverage, the number of viewers is increased, the
>advertising rate increases and the Broadcasters profit increases.

Well gee, you should have checked more carefully. Audience is measured
by the number of viewers *actually* watching a program, not just capable
of receiving it. The cable companies can carry programming that broadcasters
are *prohibited by law* from carrying. That includes most any uncut movie
made in the last 20 years. They can also carry many many more choices
than a broadcaster can because each cable channel can have a smaller
audience and still draw enough aggregate viewers for the cable system
to be profitable. Now that's good for the viewer, but it's bad for
the broadcaster. All those non-broadcast program providers to the cable
operator get *paid* by the cable operator for the priviledge of using
their material. Now the cable operators don't want to pay the broadcaster
for his material, even though they are profiting from it via the basic
cable charge that they extract from the viewers. That's wrong.

>somesuch, which has a 10 hz tuning rate and 100 hz display
>resolution, and no bfo (as far as i can tell), how can you
>exactly tune to the frequency of a station calling cq?

Short answer: you can't.

Slightly longer answer: It doesn't matter, 10 Hz is close enough, even with a 170 Hz filter he'll still hear you.

Even longer answer: There's a trick. You can adjust the "calibrate" control on top of the rig for perfect zero beat. Of course your dial calibration is screwed now, but it does work when you absolutely have to be zero beat. The "calibrate" control adjusts actual operating frequency, not the readout.

Finally, the rig does have RIT and XIT so you can do the offset that way.

>
>What would you do under these circumstances?
>
I wouldn't worry about it. People lose manuals all the time. The person
who started this "hot radio" thread is extremely paranoid and seems to view
himself as a self-appointed "radio cop." Pray that he's not your local
OO or repeater coordinator. Enjoy the rig and make lots of QSOs!

Grey market goods are not "smuggled" - they are completely legal and
legit. The only problem with grey market is the potential loss of US
warrenty. Some companies will not honor the international (i.e. non-US)
warrenty, and you must depend upon the seller to provide any warrenty
service. A reputable dealer will inform you of this. Some New York camera
shops will even give you a choice...grey market goods at a low price or US
warrenty items for a few dollars more.

Followups to rec.radio.amateur.policy, the toxic dump of Usenet. :-) :-)

This test is fraught with error.

I recently purchased an Icom 735 from a friend. It included a receipt,
Fed Ex airbill from a ham radio store, warranty card, original packaging
but no manual. I know the provenance of the rig and it is not stolen.
Yet, it did not come with an operator's manual. The seller had misplaced
it.

For $10 I obtained a new manual from ICOM with no questions asked.
So could any one else.

Hardly makes for an acid test does it?

>I purchased a radio recently through "rec.radio.swap" that claimed to be an

4139. commercial rig modification questions

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-24 14:34:52 UTC
From: j_otterson@otters.enet.dec.com
Message-ID: <1993Jun24.143452.874@jac.nuo.dec.com>
Source record: 279957

I am posting this question again, the complete lack of response makes me suspect that it never made it out of my site...

Here is a technical question for the PLL/Frequency Synthesizer wizards who I just know are out there...

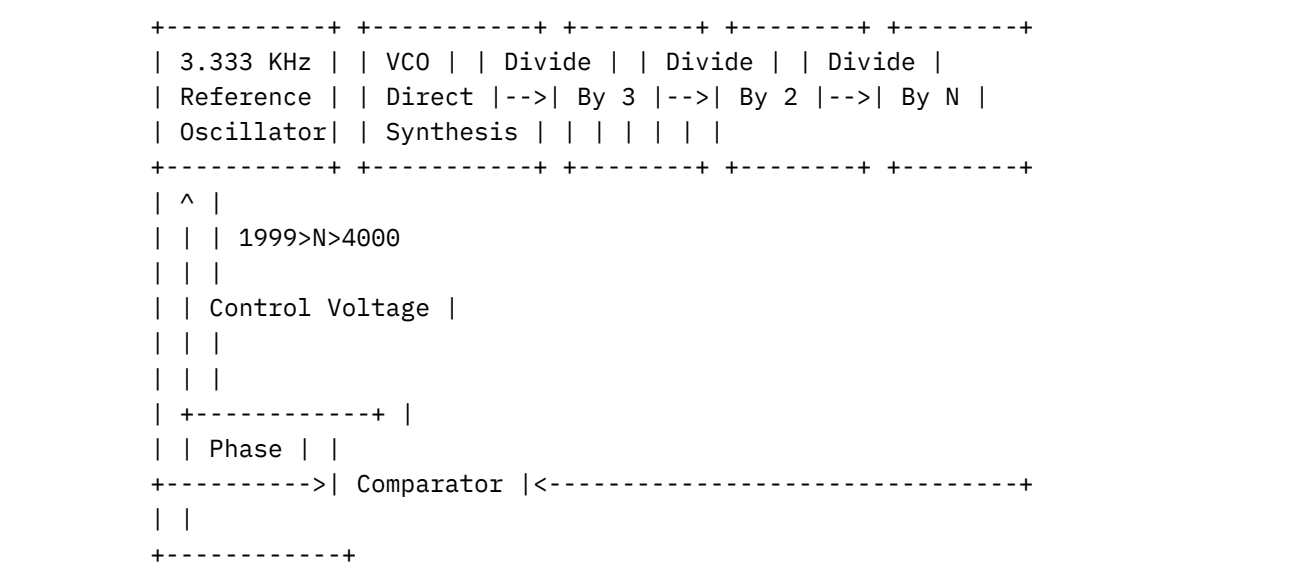
At the Flea last fall, a few folks I know (including myself) bought some Standard Radio C966L VHF Lo-band Mobile Commercial Radios, with the intent of using them on 6. These are 16 channel, 75 watt synthesized rigs, and we all thought it would be "no problem" to convert them for use on 6 meters.

Well, they *do* work on 6, but not on all the channels used by hams. These radios want to have channels on even multiples of 20KHz, i.e. 52.00, 52.02, 52.04, etc. but the 6 meter repeater frequencies are often in *odd* multiples of 20 KHz: 53.59 for example.

So the problem is, how to get the radios to work on either: (A) odd 20KHz channel spacing, or better yet, (B) 10 KHz channel spacing.

PLL Synthesizer Block Diagram and Theory of Operation*
(* at least as I understand it...)

The VCO Frequency is the desired frequency plus 10.7 MHz. It is divided by 3, divided by 2, and then divided by factor "N". The result of all these divisions should be 3.333 KHz, the same as the reference oscillator. If it is not 3.333 KHz, the Phase Comparator makes an adjustment to the VCO control voltage to correct it.



I have come up with the idea of removing the divide by 2 stage, and changing the divide by N stage to allow N to be increased by a factor of 2. This

would require changing the divide-by-N chip to a part that would allow a larger divisor... The part that is in the radio now is a 14-bit BCD divide by N counter. I could use a 12-bit binary divide by n part, which would give me sufficient range, but I cannot determine if such a part even exists...

Another idea that we have tossed around is to change the transmit offset oscillator, and the 2nd IF oscillator to be 10 KHz below their current values, which would meet (A) above, but not (B).

Does anybody have any ideas?

Thanks. Jeff.

>1. Why do you say PVC is bad at HF? It is certainly a nonconductor.
> The use of PVC may have HF limits because of flexibility in long
> large HF beams, but I'm unaware of any other PVC shortcomings.

From what I've heard (many times, from different people), PVC is not an
effective insulator at HF frequencies, as was originally thought. I just
did a quick (*VERY* quick...as in, looked in the index) check in the
Antenna Book, and didn't find anything, but this doesn't say much. :-)
Later, when I get more time, I'll try to find more info.

4142. Toroidal Inductor Arcing to Core

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-24 15:00:14 UTC
From: waltk@pica.army.mil
Message-ID: <9306241100.aa18108@COR5.PICA.ARMY.MIL>
Source record: 279959

Hey All: Here's one for those experienced in working with
toroidal inductors. I recently built an HF linear amp (3x4-400)
and used a powdered iron, 3 core, inductor for 80 & 160M.
When on 15M the toroid begins arcing to the core. The toroid
is wound w/abt 20 turns of 12ga. Thermaleze wire. The 3 cores are
(Red) T-240 material, glued in a stack and wrapped w/abt 3-4 layers
of 3M-Fiber Glass Tape. I discovered that if I shorted the adjacent
turn to the 15M tap, that is to the 20M tap, the problem went away.
Also, if I shorted just the 80 & 160 taps together when on 15 the
arcing also went away. Now, my question is why does this happen??
Any and all ideas would be appreciated.

Hmmm...It sounds like the cores are saturating. I would use at least 2 T-300-2A (A for double width) or a single T-400-2A core. I have a T-400-2A in a 4-1000 and don't have any problems with it. When wrapping each layer, I saturate the fiberglass tape with "Q-dope" and let it harden before applying the next layer and building up 4 layers on the core.

I got my HTX-202 at a local ham radio dealer here in Omaha (Ladd Electronics) that was traded in for one of the tiny Icoms (I don't remember which one) after being used for only a few weeks. It only cost me (please sit down) $150.00! Although I have not yet recieved my license (sp?) after a month of waiting, I do use it as a scanner for 2M in my car with an external antenna and 12v cig. adapter. For the first time ham, I think that the HTX is an excellent buy, but make sure to check out any ham dealerships in your area to see what used items they have for sale. You can save big $$$ this way.

Can someone please provide a summary of the 39 "PL" tones defined by the EIA?
My (Canadian) reference library doesn't have this document; my short list
presently contains merely the entries 103.5Hz, 127.3Hz and 181.8Hz.

Source record: 279958

>In Lars's article he asked about Morse training techniques

The thing that I have found most useful is to increase your
wpm speed as soon as you start copying 50-60% of the text
correctly. And then occasionally slow it back down to give yourself
the satisfaction and encouragement of seeing your improvement.

Also I have found that when just learning the letters it was best just
to do short sessions at a sitting so that you would not get discouraged.
And once you have mastered the letters, numbers, and prosigns you can
start doing longer sessions (20-30 minutes).

And if this is not obvious...try not to teach Morse by sight, unless
all else has failed. When I was little I learned Morse code by sight
from the Radio Shack walkie talkie that I had, and it took me the
longest time not to do the translation in my head and just hear the
letters and words.

I hope this helps and please summarize the responses you get to the
net.

4148. ALERT: MAJOR SOLAR FLARE ALERT - SUSPECTED PROTON FLARE

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-24 16:06:27 UTC
From: oler@rho.uleth.CA
Message-ID: <9306241606.AA25464@rho.uleth.ca>
Source record: 279964

/\

MAJOR SOLAR FLARE ALERT

ISSUED: 14:00 UT, 24 JUNE

/\

* NIL to Low Impact Possible *

MAJOR ENERGETIC EVENT SUMMARY:

(All times are valid for the UT day of 24 June)

Flare Size: Class M9.7/1N
Location: S11E64 (Region 7529)
Tenflare: 390 sfu at 0722 UT.
SESC Times: Begin=24/0716 UT, Peak=24/0735 UT, End=24/0752 UT
(SESC Times are based on a half-power-point system)
Sweeps: Type II (Importance 3).
Estimated shock velocity: 2500 km/sec.
Begin: 0729 - 0736 UT.
Type IV (Importance 3).
Begin: 0659 - 0900 UT.
Protons: Proton enhancement expected over next 24 hours. Possible event.

PRELIMINARY X-RAY TIME PROFILE DATA AND ESTIMATED STATISTICS:

BEGIN (XRAY)	MAX (XRAY)	END (XRAY)	DURATION	INTEG. FLUX	SWF DUR.
0640 (B4.7)	0736 (M9.7)	0830 (C9.8)	110 MIN.	0.154 J/m^2	062 min

NOTE: The xray time profile data above is not based on the half-power-point system, but is intended to give a general idea of the duration of the entire event, from the start to the end when xrays fall below M-class levels. Integrated x-ray flux covers the interval from start to end.

SYNOPSIS:

Region 7529 spawned a major class M9.7/2B tenflare from S11E64 at 07:35 UTC. It was accompanied by major Types II and IV sweeps. The estimated shock velocity of the Type II was 2,500 km/sec. The x-rays from this region have shown impressive surges with long-decay signatures throughout the last 24 hours. The flare itself was similarly long in duration and had an impressive LDE signature. The region has not been magnetically imaged to provide us with any quantitative information regarding shear levels or magnetic configurations. However, it will be closely

scrutinized today. When it rotated into view yesterday, the region did not appear to be capable of producing large flares. X-ray imagery of this region was relatively dim. Likewise, it was not associated with any strong limb emissions (Ca XV or Fe emissions). But today, imagery is showing strong x-ray emissions from this region.

There is another region rotating into view behind Region 7529. It might possibly be old Region 7518. A bright surge was reported in the area of this new region.

Additional major flares are likely from Region 7529.

POTENTIAL TERRESTRIAL IMPACT ASSESSMENT:

The following tables depict the preliminary estimated potential for terrestrial impacts in various categories. These tables are valid only for the flare described and do not include assessments for previous influential flare events.

POTENTIAL MAGNITUDE OF DISTURBANCE

HIGH : 05 %
MODERATE : 10 %
LOW : 30 %

4149. WARNING: Potential Satellite Proton Event Warning

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-24 16:16:11 UTC
From: oler@rho.uleth.CA
Message-ID: <9306241616.AA26317@rho.uleth.ca>
Source record: 279965

/\

POTENTIAL SATELLITE PROTON EVENT WARNING

ISSUED: 08:00 UT, 24 JUNE

/\

ATTENTION:

A suspected major proton flare erupted from S11E64 (new Region 7529) at
07:35 UTC. An enhancement in protons at greater than 10 MeV is expected over
the next 24 hours. The probability of them actually arriving is rather
uncertain - models indicate a 46% probability with a peak flux near or
slightly above 10 pfu.

More importantly, this region appears to be capable of producing
additional significant energetic proton flares. As it rotates into an
increasingly favorable geoeffective position, the probability for seeing
potentially high proton levels at potentially high energies will increase.

Use the Internet command: "finger solar@xi.uleth.ca" for current plots
of protons at greater than 1, 10 and 100 MeV.

Radio communicators are warned of the possibility for seeing polar cap
absorption activity over the next two weeks from potentially significant
proton flares.

This warning will remain active until 05 July.

** End of Warning **

4152. Re: Summary: Making home Ham Friendly

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-24 16:23:54 UTC
From: dts@banyan.com
Message-ID: <C94w7u.FA4@squam.banyan.com>
Source record: 279978

Another potential fix to GFI problems would be to move the GFI location. It is possible to install GFI circuit breakers in your distribution panel rather than at the outlet. It is not clear to me whether the interference problem would be the same or not, as the device configuration is different.

Even if the GFI breaker approach did not directly solve the problem, it would likely be easier to install the common mode chokes (if required) shortly after the distribution panel. The choke would then be NEAR the GFI, and in a place where the wires are more likely to be accessible (especially if you have an unfinished basement).

/\

POTENTIAL MAJOR SOLAR FLARE WARNING

ISSUED: 14:30 UT, 24 JUNE

/\

PRIMARY CANDIDATE FOR HIGH SOLAR ACTIVITY : REGION 7529 (S11E60)

ESTIMATED POTENTIAL MAGNITUDE OF ENERGETIC ACTIVITY OVER NEXT 7 DAYS						
DAYS	C5.0	M1.0	M5.0	X1.0	X5.0	>X12.0
1( )P	95 %	50 %	30 %	05 %	5 %	1 %
3( )PG	100 %	65 %	50 %	30 %	10 %	1 %
5( )PG	100 %	80 %	60 %	40 %	15 %	2 %
7( )PG	100 %	90 %	70 %	40 %	20 %	2 %

DAYS = Number of days (from present) into the future (1, 3, 5 and 7 days).
(+) = Primary candidate region expected to GROW and DEVELOP.
( ) = Primary candidate region expected to STABILIZE or remain STABLE.
(-) = Primary candidate region expected to DECAY and SIMPLIFY.
(x)P = Possible proton and/or PCA threat. (x) may be one of (+), (-), or ( ).
(x)G = If a favorable major flare develops, a moderate to high probability exists that the event may be geoeffective.
xx % = Probability of activity equalling or exceeding the given x-ray class sometime over the next number of DAYS.
WLT = Data not applicable due to the West Limb Transit of the target region.

The above chart should be used as a guide only. It represents anticipated levels of activity based on current projections of region development. Actual conditions may, of course, differ from these projections.

SYNOPSIS:

Region 7529 (S11E60) produced a major M9.7/2B Tenflare with major Types II and IV sweeps at 07:35 UTC on 24 June. Preliminary analysis of this region indicates that it may be capable of supporting additional strong major flares over the next week at least. Proton flares are a very real possibility. This latest event was a suspected proton flare. Most indicators point toward additional major flare activity from this spot group.

This warning will be updated as necessary over the coming days. This is a potentially significant solar region and should be monitored closely.

This warning will remain active until 05 July when it will be updated
or allowed to expire.

: if you have a digital transceiver, say like the icom ic735 or
: somesuch, which has a 10 hz tuning rate and 100 hz display
: resolution, and no bfo (as far as i can tell), how can you
: exactly tune to the frequency of a station calling cq?

I have a Kwd TS-440 so you mileage may vary. I made the modification to display 10s of Hz.

For CW, I tune for maximum S-meter reading. I have a 500 Hz filter. I've configured the radio to emit a 400 Hz CW tone. I suppose I could make a 400 Hz oscillator and beat to that. In practice it doesn't matter too much.

For SSB, I assume the guy I'm talking to didn't choose 14.314.159 on purpose and wanted me to tune his exact frequency. I tune until it sounds reasonable, then round off to the nearest .25 KHz multiple. I live about 10 miles from WWV and my VFO is calibrated fairly closely.

Once I transmit, I assume the other guy will use his RIT (receiver incremental tuning) if my signal isn't where he wants it. I don't adjust my transmitter, otherwise we might start dancing across the band.

In the ongoing debate on payment by cable companies to broadcasters, gary@ke4zv.UUCP (Gary Coffman) writes:
>
... a few lines have been deleted for brevity ...

>the broadcaster. All those non-broadcast program providers to the cable
>operator get *paid* by the cable operator for the priviledge of using
>their material. Now the cable operators don't want to pay the broadcaster
>for his material, even though they are profiting from it via the basic
>cable charge that they extract from the viewers. That's wrong.

There is at least one other perspective. It is that of respecting others' intellectual property rights and paying them for using their products. Not paying broadcasters after selling their material affects consumers too. It reduces the revenue to broadcasters and hence their willingness to produce new, and probably expensive, programming. Enforcing intellectual (very loosely speaking, of course) property rights fosters innovation and creativity. Can you imagine a situation in which all commercial software were available for a song on a cable brought to your house? Do you think that Lotus, Microsoft or any other business would devote any resources to developing new products in such a situation?

: Any and all ideas would be appreciated.

: 73 de Walt - K2WK

You might have a self-resonant inductor. i.e. it is a short at certain useful frequencies like 15 meters. Try coupling a dip meter into the open-circuit toroid with a loop of wire. Then, _slowly_ sweep from DC to 30 MHz and see where the dips are. Some self-resonances are extremely high-Q and you won't see them on the dip meter if you sweep past too quickly.

You don't mention what the toroid is used for. I built a plate choke as outlined in the ARRL Handbook. Maybe you'll need multiple toroids to avoid a self-resonance.

4159. SCOM Repeater Controller Spurious Reset Help

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-24 18:00:22 UTC
From: millar@mervax.sanders.lockheed.com
Message-ID: <millar.34.0@mervax.sanders.lockheed.com>
Source record: 279981

My repeater with an SCOM 5K controller has developed a problem with resets. Several times a day (or even more often), The controller sends "? RES" indicating a reset. Sometimes this is preceeded by the transmitter keying in very short pulses at a rate of about 2 per second.

These symptoms appear consistant with the processor partially or totally crashing followed by the watchdog timer going off and resetting the controller.

We have speculated about the source of the problem...

- bad internal processor voltage: checked ok
- bad solder joint: no mechanical intermittents
- who knows what else?

If anyone out there can help with more specific suggestion where to look, we would appreciate it.

I have to say that if the processor actually crashes and gets recovered by the watchdog timer, then SCOM did a truely wonderful job. Because the overall operation of the controller continues to provide repeater service... just with the annoying "? RES" cw and the "blip blip blip" from the transmitter. Not too many computer systems continue to work if the processor crashes regularly.

The views expressed here are my own, not my employer's.

The point of this analogy is lost on me. However, how would you feel if
your neighbor got all his software free but you had to pay? The perception
is that broadcasters are "giving" their programs away and now want a captive
audience to pay for it.

My 2 cents.

4161. Re: TV vs Cable. Why Pay for a FREE Signal

>
By this logic the makers of television sets should pay the broadcasters because they are picking the signal out of the air. Rebroadcasting material (assuming it is unaltered) is doing the same thing. Orignially the cable companies started by providing service to areas that could not pick up tv signals that well (people in valleys for instance). The cable company would place an antenna on top of a mountain to receive the signal and provide that to the local users. They weren't stealing, they were providing a service (a big antenna). If they were using part of the signal to rebroadcast only the material that they wanted (editing out the commercials for example) then they would be violating the copyright.

Also, many of the channels on the cable are NOT paid for their programming. They get their money by selling advertising. Case in point: Ted Turner's superstation.

>From Tad Cook, KT7H, Seattle, WA
May 28, 1993
Relayed by KB8NW/OBS & BARF-80 BBS
To all radio amateurs

SB PROP ARL ARLP021
ARLP021 Propagation de KT7H

Solar activity was very low again last week. The solar flux stayed
below 100 for most of the period, which is part of the gradual trend
downward as we head toward the minimum of the current solar cycle.

The positive side was that geomagnetic conditions were extremely
quiet. The A index was actually between zero and two all week,
which is almost unheard of. Those numbers would be good even if
they were K indices. The K index was zero or one for most periods.

Solar flux is starting to head back up, but should show a slow
modest rise to only 110 before mid-June, when it will then drop back
down below 100 around June 21. Geomagnetic conditions should stay
quiet throughout the month, but there is a possibility of a
disturbance over the weekend during the WPX CW Contest.

Twenty meters looks like the best all around HF band, with more
openings during the evening hours as we shift toward summer
conditions. Lower frequency communications should be more of a
problem due to seasonal increases in atmospheric noise.

Sunspot numbers from May 20 through 26 were 48, 34, 22, 13, 38, 55
and 88, ith a mean of 42.6. 10.7 cm flux was 91.1, 91, 91.8, 94.9,
98.4, 99.8 and 107.5, with a mean of 96.4.

The path projection for this week is also to Spratly Island as it
was last week, but this time from the west coast of the United
States, centered on San Francisco.

75 and 80 meters should be good from 1030z to 1330z, with the best
conditions around 1200z. 40 meters should be open from 1000z to
```

1430z, but best from 1130z to 1300z. 30 meters should be open from 0930z to 1530z, peaking from 1030z to 1400z. 20 meters should be open from 0800z to 1700z, with best bets from 0930z to 1530z. The best time for 17 meters looks like 0630z to 0800z, but other possible openings may be from 1400z to 1830z. 10, 12 and 15 meters do not look very promising, although 15 meters may have some openings on the west coast end from around sunset until 0830z.

Actually, this is one of those GFI-breaker-and-wall-plug-in-one units. Outlets upstream from the breaker (there are several) are unprotected, but that outlet and all downstream (all the bathrooms) are protected. My thought was to bypass the stuff heading into the breaker at that plug itself, since it is on the protected side. As you point out, that will only work for differential mode interference, which seems unlikely.

Since I doubt I would be allowed to dig into the wall to get at the wires right at the outlet, my choices seem to be:

1. Find another spot to access the down-stream wire and either:

a) put the ferrite there (which may make things better or worse)
b) insert 1/8 wave of wire (keeping electrical code, etc. in mind)

2. As Daniel suggests, move the GFI to the electrical panel, which:

a) changes the length of the protected part (may be better or worse)
b) allows access to the wires for inserting ferrite

3. Continue to stay off 15 meters :-(

Thanks for the help. If I do solve this thing, Ed, I'll beam you some E-mail.

Wayne-

I've been collecting "trivia" about the HTX-202, hoping to find some grand modification, but to no avail! Some think it is already as good as anyone wants. However, the following bits of information may be of interest:

1. It turns out that there are actually two versions of the HTX-202. The manual that came with the early one did not include the F-Light feature (turning on the light for an indefinite period), although the radio had the capability. The later manual did have the feature listed on page 15, at the bottom of the page.

You can tell which version of the radio you have, by checking the frequency that comes up when you reset the microprocessor. The older one resets to 144.-something. The newer one resets to 146.00 MHz.

2. The service manual indicates that peak deviation should be set to 3.8 KHz. That is about what mine was when it came from the factory, although avarage modulation was not bad. I recommend that you either set peak deviation to 4.5 KHz, or set it to 5.0 KHz with CTCS turned on.

3. Some of the HTX-202's came with low modulation. The "word" was that you could correct this by adjusting the peak deviation control, RV1, located near crystal X1, on the RF PCB. However, some had other problems, and were still distorted when adjusted. I haven't heard what the actual cause of the problem was.

4. The manual indicates that the "Er1" error code is caused by an internal RAM error. When it occurs frequently, the internal Lithium battery is generally blamed. However, the Lithium battery may not be the only cause of the problem. According to Dave, AC4JX, the "Er1" occurs frequently when using an external 12 volt power supply, and the radio is turned on and off by switching the power supply instead of using the radio's on/off switch. If this is true, it may be that the CPU does weird things when voltage is somewhere between the Lithium battery's voltage, and normal operating voltage, like writing garbage to RAM! An external power supply's voltage can rise and fall at a rather slow rate, which invites the problem.

5. Do some of the HTX-202's have trouble dialing through an autopatch when their signal is weak and noisy? If so, it may be due to the lack of pre-emphasis on the DTMF tones. It may not turn out to be a problem, but

this lack of pre-emphasis is the only genuine design flaw I'm aware of!

6. Some repeater autopatches have a problem with the HTX-202's carrier staying keyed after the last digit is dialed. This can be overcome by turning on the "Touch-tone Auto-reply", function Ar in the configuration menu.

7. The Radio Shack "Speaker-Mike" works with Icom and some Yaesu, as well as the HTX-202. Mine sounds at least as good as the HTX's built-in speaker, and cost less than the Icom speaker-mikes. However, I found that my old Icom speaker-mike doesn't work with the HTX. It seems that the resistor used in the Icom microphone, is too high a value to key the HTX's push-to-talk. Icom uses something like 39K ohms, while the Radio Shack speaker-mike uses 2.2K ohms.

8. Although the HTX-202 appears to be Icom "compatible", you may not be able to use an Icom interface cable with the HTX on packet. As mentioned above, the P-T-T resistor must changed to a lower value to key the HTX-202. If you modify the cable, it should still work with Icom.

9. To get full power from the HTX-202, you must power it from an external 13.8 volt power supply. It turns out that some Icom battery packs are compatible, and are available in higher voltages. Although it runs up your investment in the radio, you could get the 13 volt Icom rapid charge battery, and the Icom BC-35 charger. This large battery allows nearly full power, and 1 or 2 hour recharge. I think the battery is the BP-7. Both the BP-7 and the BC-35 each cost about $85 at AES, for a total of $170.

10. I don't know how much Radio Shack charges for a replacement battery. If your old battery dies, you can get a refill. Order an "HTX-202 Insert" for $15, 7.2 Volt 600 mAH, from:

E. H. Yost & Company
7344 Tetiva Road
Sauk City, Wisconsin 53583
Telephone (608)643-3194

Yost may also have the higher voltage battery packs.

11. There have been several reports of a "birdie" signal on 146.76 MHz. It appears to be caused by the 146.761345 MHz, 41st harmonic of the 3.579545 MHz crystal used as the CPU clock. This crystal is also used in the touchtone generator circuit. It would seem possible to pad capacitor C-1018 (20 pf), to move the harmonic off frequency. It wouldn't require much, and probably wouldn't upset either the CPU or the touchtone generator. However, there isn't much space for additional components near C-1018. Further, C-1018 is a chip capacitor that would be damaged if conventional solder were used near it.

Why not get a 2 meter HT, along with a wide band rcv such as the ICOM W2A? I think that's the right model #, in any case it rcvs 100k-1g in all modes except ssb. I had one for a while, but just wasn't into receiving. It would rcv air band (unmodulated fm on 108-135mz), police, fire cellular etc...

Yep. The Icom IC-2AT...good rig. Works flawlessly. Good receiver with
not too much intermod problem. And, when you get tired of hamming, it
doubles as a fine hammer for banging dents from your car! ;^)

Price has held because it DOES what it says it will, has no bells nor
whistles to break, and is just a fine handheld...still, within your
range!

DEFINITIONS:

Date (day only)
10.7 cm SOLaR radio FLuX forecast
HF Propagation Conditions for LOw, MIddle, HIgh, and POlar areas (see below)
HF Short Wave Fade Probability (in %)
HF Maximum Usable Frequency in +/- percent above seasonal normals.
HF Prediction CONfidence Level (in %)
VHF Sudden Ionospheric ENHancement Probs (in %), weighted for low-mid lats
PROBability of "s"poradic E (Es) during the UT day for low, mid and high lats
VHF AUroral BacKScatteR Probs (in %) for LOw, MIddle and HIgh Latitudes
VHF Overall Global DX Potential (in %) - weighted for Low and Middle latitudes
Geomagnetic Activity Kp Index (peak value - see below)
GeoMAGnetic Activity Ap Index (peak value - see below)
AURORAl Activity for LOw, MIddle and HIgh Latitudes (see below)

HF Prop. Quality rated as: EG=Extremely Good, VG=Very Good, G=Good, F=Fair,
P=Poor, VP=Very Poor, EP=Extremely Poor.
```

Probability of Sporadic E (Es) for the various latitudes is given in percent.
Kp Planetary Index rated: 0=V.Quiet, 1=Quiet, 2=Unstld, 3=Active, 4=V.Active,
5=Minor Storm, 6=Major Storm, 7=Maj-Sev Storm, 8=Severe Storm, 9=V.Severe.
Ap Planetary Index rated: 0-7=Quiet, 8-16=Unstld, 17-29=Active,
30-49=Minor Storm, 50-99=Major Storm, Severe Storm >=100.
Auroral Activity rated: NV=Not Visible, LO=Low, MO=Moderate, HI=High,
VH=Very High.

```

CONFIDENCE LEVEL: 55%

CONFIDENCE VALUES ARE RELATIVELY LOW GIVEN THE FACT THAT
LITTLE IS KNOWN REGARDING THE POTENTIAL INFLUENCE THE STRONG
ACTIVE REGIONS ON THE EAST LIMB MAY HAVE ON THE EARTH OVER
THE NEXT WEEK.

NOTES:
Predicted geomagnetic activity is based heavily on recurrent
phenomena. Transient energetic solar events cannot be predicted reliably over
periods in excess of several days. Hence, there may be some deviations from
the predictions due to the unpredictable transient solar component.

Chart Start Date: Day #116

NOTES:
This graph is determined by plotting the greater of either the planetary
A-index or the Boulder A-index. Graph lines are labelled according
to the severity of the activity which occurred on each day. The left-
hand column represents the associated A-Index for that day.
Q = Quiet, U = Unsettled, A = Active, M = Minor Storm,
J = Major Storm, and S = Severe Storm.

GRAPHICAL ANALYSIS OF 90-DAY AVERAGE SOLAR FLUX
-----------------------------------------------
```

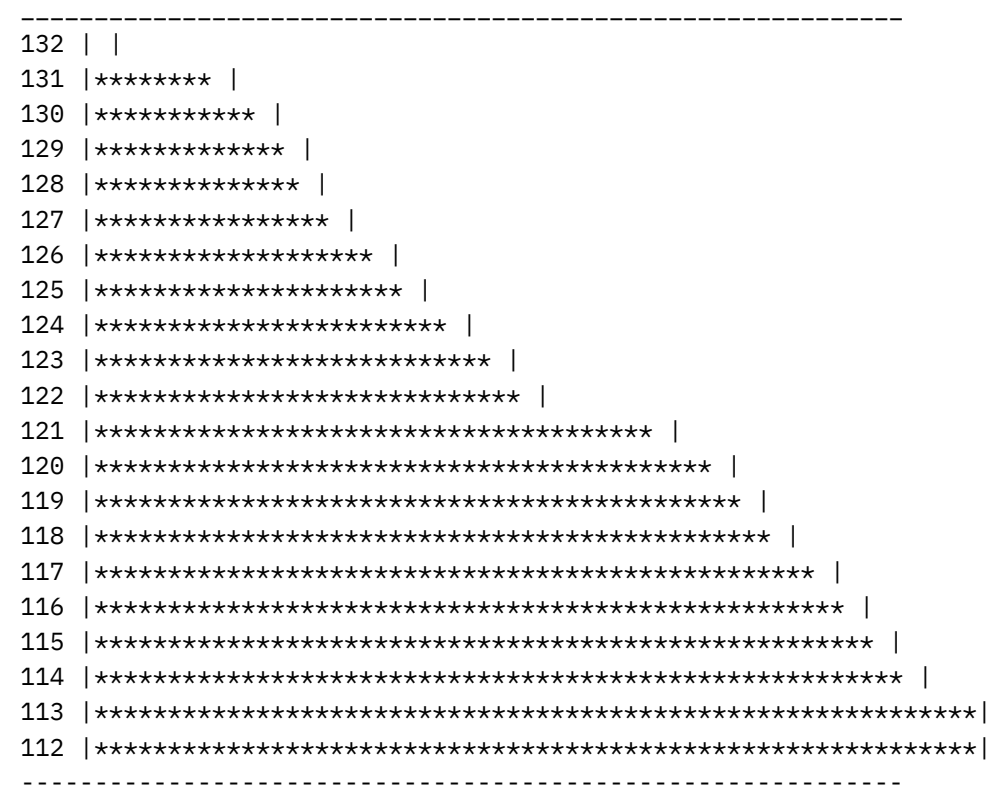

Chart Start: Day #116

NOTES:
The 10.7 cm solar radio flux is plotted from data reported by the Penticton Radio Observatory (formerly the ARO from Ottawa). High solar flux levels denote higher levels of activity and a greater number of sunspot groups on the Sun. The 90-day mean solar flux graph is charted from the 90-day mean of the 10.7 cm solar radio flux.

CUMULATIVE GRAPHICAL CHART OF SUNSPOT NUMBERS

4174. ALERT: Major Solar Flare Alert - 25 June

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-25 05:18:36 UTC
From: oler@rho.uleth.CA
Message-ID: <9306250518.AA04256@rho.uleth.ca>
Source record: 279998

/\

MAJOR SOLAR FLARE ALERT

ISSUED: 04:30 UT, 25 JUNE

/\

* No Impact Expected *

MAJOR ENERGETIC EVENT SUMMARY:

(All times are valid for the UT day of 25 June)

Flare Size: Class M5.1
Location: S06 (Unseen Region)
Tenflare: None.
SESC Times: Begin=25/0302 UT, Peak=25/0322 UT, End=25/0332 UT
(SESC Times are based on a half-power-point system)
Sweeps: Type II (In-progress).
Estimated shock velocity: 750 km/sec.

PRELIMINARY X-RAY TIME PROFILE DATA AND ESTIMATED STATISTICS:

BEGIN (XRAY)	MAX (XRAY)	END (XRAY)	DURATION	INTEG. FLUX	SWF DUR.
0303 (B7.9)	0322 (M5.1)	0342 (C9.4)	039 MIN.	0.059 J/m^2	033 min

NOTE: The xray time profile data above is not based on the half-power-point system, but is intended to give a general idea of the duration of the entire event, from the start to the end when xrays fall below M-class levels. Integrated x-ray flux covers the interval from start to end.

SYNOPSIS:

A major-category class M5.1 flare erupted from just beyond the southeast limb near S10 at 03:22 UTC on 25 June. The event was not particularly strong. However, it does confirm that the region due to rotate into view is quite volatile. Additional strong minor M-class flares and possible major events are expected from this unseen region.

POTENTIAL TERRESTRIAL IMPACT ASSESSMENT:

A geophysical impact is not expected from this event.

/\

4175. AURORA WATCH: Middle Latitude Auroral Activity Watch

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-25 05:28:31 UTC
From: oler@rho.uleth.CA
Message-ID: <9306250528.AA05214@rho.uleth.ca>
Source record: 279999

/\

MIDDLE LATITUDE AURORAL ACTIVITY WATCH

ISSUED: 05:00 UT, 25 JUNE

/\

NOTE: We are beginning to provide special satellite images of auroral activity over the Antarctic polar regions from the DMSP F11 satellite. Anonymously FTP to the site "xi.uleth.ca" (IP number 142.66.3.29) and grab the GIF-formatted images from the directory "pub/solar/Aurora/Images". We hope to provide at least one image per day while the terminator is away from the Antarctic region. These images are obtained from the low-light camera's on-board the F11 DMSP satellite. The camera mode combined with the fact that there is no moon is the cause for "noise" in the images. Convolution filters will eliminate this noise. Files have the format "DDDHHMMv.GIF" where DDD is replaced with the day number in the current year (001-365), and HHMM represents the hour and minute (in UTC time) of the observation. The "v" indicates that the image is a visible-light image.

VALID UNTIL: 19:00 UTC ON 27 JUNE

MODERATE RISK PERIOD: 25 - 27 JUNE (UT days)

PREDICTED ACTIVITY INDICES FOR NEXT 4 DAYS: 25, 25, 20, 15 (25 - 28 JUN)
(INPUT INTO THE PREDICTIVE AURORA SOFTWARE *)

POTENTIAL MAGNITUDE OF MIDDLE LATITUDE AURORAL ACTIVITY: MODERATE

ESTIMATED OPTIMUM OBSERVING CONDITIONS: SUNSET TO 01:00 AM LOCAL TIME

EXPECTED LUNAR INTERFERENCE: LOW - MODERATE

OVERALL OPPORTUNITY FOR OBSERVATIONS FROM MIDDLE LATITUDES: FAIR

AURORAL ACTIVITY MAY BE OBSERVED APPROXIMATELY NORTH OF A LINE FROM...

MOST OF THE NORTHERN U.S. STATES AND SOUTHERN CANADA FROM SOUTHERN BRITISH COLUMBIA TO CENTRAL MONTANA TO NORTH DAKOTA TO MINNESOTA TO MICHIGAN TO NORTHERN NEW YORK STATE TO SOUTHERN MAINE AND POSSIBLY PARTS OF NEW HAMPSHIRE.

ACTIVITY MAY ALSO BE OBSERVED APPROXIMATELY NORTH OF A LINE FROM...

NORTHERN U.K. TO THE NORTHERN EUROPEAN REGIONS INCLUDING MUCH OF THE NORTHERN AND CENTRAL PARTS OF NORWAY, SWEDEN AND FINLAND, TO NORTHERN RUSSIA. THERE IS AN OUTSIDE CHANCE AUSTRALIAN AND NEW ZEALAND REGIONS MIGHT SPOT ACTIVITY.

* Contact: Oler@Rho.Uleth.CA or COler@Solar.Stanford.Edu for more information regarding the Auroral Activity Prediction and Simulation Software.

SYNOPSIS...

A strong major solar flare that erupted at 07:35 UTC on 24 June combined with a well-placed solar coronal hole are expected to produce enhanced levels of auroral activity on 26 and possibly 27 June. Most of the activity is expected on 26 June following the arrival of the flare shock. Although nothing particularly significant is anticipated, there is an outside chance for minor auroral storm conditions.

Auroral activity is already enhanced and is visible over the high and polar latitude regions. Lunar phase will not significantly inhibit attempts to view activity.

This WATCH will remain active until 19:00 UT on 27 June when it will either be updated or allowed to expire.

** End of Watch **

4176. CT lookalike for FD

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-25 05:56:04 UTC

When I ran it through the copy of uudecode I have it didn't produce a
working file.

Just for the record: the relevant part of the message was written to a file
on a VAX with VMS. The file ?;;as then sent to the PC with Zmodem.
The received file didn't seem to have both CR & LF (TYPE didn't have neat
lines) which I corrected. Both ways produced an unworkable .COM file.
The two .COMs gave different types of gibberish5 when run but neither
crashed the system. The second one (CRLF) did produce some nonsense text
along with the gibberish.

BTW: my uudecode.exe was compiled by Turbo C from source I got via anon FTP.

I'm looking for the address and, if possible, the fax number of
HAMRADIO magazine.

Basically, what I'm looking for is a periodic pubblication with fairly high
technical contents with also minor entries for other stuff like contesting
dxing etc. and would appreciate any comment about the above one plus
any suggestion other magazine especially 73.
I'm currently subscribed to QST and CQ but neither fully satisfies my whishes
regarding tech articles. I also had a chance to take a look to QEX but it
misses non-technical sections plus it's quite expensive for non-us subscribers.

Any suggestion is very welcome....

You're almost right next door to WR9R, who wrote a CT lookalike for Field Day only. He's up to version 3.01 now. Program costs $10. Version 3.0 is on the ARRL BBS 203-666-0578, but I forget the filename. By the way, it's not a complete lookalike, but it's close. Being a much smaller program, for one contest only, it seems to run considerably faster than CT.

In any case, WR9R is:

Larry O'Cull
4002 W. 146th Street
Westfield, IN 46074

Your mileage may vary.

4182. Re: TV vs Cable. Why Pay for a FREE Signal

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-25 12:06:54 UTC
From: bill@cs.uofs.edu
Message-ID: <20epou$7eq@gopher.cs.uofs.edu>
Source record: 280009

Everybody here seems to be forgeting one major point in this discussion.
The cable companies are not carrying the local broadcast stations because
they add value to the cable service, they carry them because the FCC told
them they had to. Most would prefer not to and I personally would prefer
that they used those 5 channels to offer me something of more value (like
even the SF Channel.) If I want to watch one of the local channels (highly
unlikely as they have absolutely nothing to offer) I can pick them up with
anything for an antenna, even a bent coat-hanger. Thre of the five trans-
mitters are line of site to my house.
In places where the broadcast station does not have this kind of coverage,
then the cable company is offering the broadcaster a service and shouldn't
need to pay for it. In areas like mine, why bother carrying it at all??

Don't get me wrong, I don't think cable companies are angels either, but they
are not outthere deliberately trying to shaft the broadcasters. TV is a very
competitive business. And if the broadcasters are to survive, they are going
to need to do something to make their channels worth watching. Re-runs of
"Cheers" and "Married - with chidren" aren't going to do it.

Of course, if you watch the blurbs on the cable, you know that they are going
thru the same thing themselves. They see companies like AT&T and MCI getting
into what they think of as their business and are running scared. They use
scare tactics ("If you let this happen, all the newspapers will go out of
business and all those local jobs will be lost!!") to try and get the public to
force the government to prevent any new competition. Thw truth is they had a
closed market that was crying for new services (like data) years ago. (Anybody
here remember the test of the modems over the cable in Colorado a few years ago??)
BUt the cable companies weren't intersted. Now the public wants it, the cable
companies can't offer it. Other companies can. And the cable companies are
running scared.
And this puts the broadcasters even lower on the totem-pole.

With the quality and level of service and the increase in places that won't
allow antennas (even for TV) it is beginning to look like the broadcast TV
era is winding down.

4183. Request help with IC4SAT

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-25 12:24:58 UTC
From: kevin@cseic.saic.com
Message-ID: <13633246@MVB.SAIC.COM>
Source record: 280008

This is my second post. I am requesting information as to whether it is possible to make my IC4SAT receive out of band, and if so, how to do it. I've heard that it can be done by removing a diode, and have also been told to just hold certain keys down during power-up. The keys didn't do it, and I don't know which diode to take out.

Someone also said that the serial number on this rig might be too low (around 1400) for extended receive, but they weren't sure.

Anyone with suggestions, please help.

Cross-posted to: sci.electronics,rec.radio.amateur.misc

I have the little demo board for the MC2833 FM tx chip, and they discuss running it at 2M and 6M. But they don't give any design details on how they derived the component values for these ranges.

I would like to know if they can run as low as 420 KHz - anyone at Motorola listening? I need some contacts there so I can determine the fesability of this project.

I bought the DJ-580T as my first rig and am really pleased with it. I hear so many hams switching back and forth to 440 that I'm glad I've got it. It also makes a dandy scanner (except for the 2 Ch/sec scan/search rate). It has expanded coverage of 110-174, 400-470 and 850-998 after snipping the red wire under the base plate - takes about 2 minutes. Note that Alinco apparently made a recent (two months ago) production mod to the 580 which reduces intermod - I've had no problems in high RF areas with mine, even with the ANLI duck.

I can also reccommend the ANLI 800 dual band antenna. With the thin duck attachment it raised a signal 4 S-units, with the whip collapsed it raised it 6 S-units and with the whip extended (to 30.5") it raised it 7 S-units (over the Alinco duck). It looks sharp too!

[Stuff about 2m vs. 2m/70cm HT's deleted]

If you have any 70cm repeaters in the area, spend the extra money
and get the dual band rig. I would much rather own a DJ-580 over
a RS HT. The Alinco is modifiable, where the RS really isn't.

I use PVC and ABS (black) plastic at 80 Meter wavelengths. Some folks suggested using the microwave as a test to see if the material was going to conduct RF. The problem is that while ABS is somewhat conductive at 2GHz, it seems to be a good insulator at 3.6 MHz. The ABS is black, and the black coloring may well add to conductivity. Certainly has not had any trouble in my loading coils on 75 and 80M half-length dipoles.

Personal experience this time, not an "old wives' tale":

Moving the GFI to the breaker box seems to have done little good in our house. This puts everything in the bathroom on the GFI, including the lights. So when I'm taking a shower at night, and my dad keys down . . . . And what's worse, you then have to go all the way outside to the box to reset it, instead of just punching a button in the bathroom. This also happens to the garbage disposal, but that's not quite as much of a nuisance.

I was project co-ordinator with SAREX for STS-47 here in Wake County, NC. I know the excitment and hard work involved in preparing for a SAREX contact. My question is simply, did the president preempt the scheduled contact for the above mentioned school, irreguardless of the potiential for success ? I did not see any mention of any students 'sharing' in the tele-conferencing, what exactly happened there ?

4201. How is Collins equipment ?

Newsgroup: rec.radio.amateur.misc
Date: 1993-06-25 17:41:35 UTC
From: mohan@tulip
Message-ID: <1993Jun25.124135.4506@uoft02.utoledo.edu>
Source record: 280020

Hello,

I gave the Tech and Novice exams on June 12th and passed them. While I am waiting for the license I want to look for equipment.

I went to a Hamfest last week in Monroe, MI and there saw a couple of Collins equipment. The "S" Line of transmitter and receiver.

Can someone here give me some info regarding the following:

1. What is the difference of having a transceiver and separate transmitter and receiver setup. Can you tell me the comparision of such setups.

2. Also what do you think about the Collins. The person selling the Collins asked about $550 for the transmitter+Receiver+Powersupply. Is this ok price?

3. What are the popular Collins equipment ?

Please let me know what you think. :) Thank you.

Thanks for the info, but that is not the one I am looking for. Altho in the
documentation it does reference the one I want, NA by K8CC. So, Does anyone
know where NA by K8CC can be found on internet? I couldn't find it in
wuarchive.

Thanks,

: worked wonderfully. I was really pleased.

David,

I, too, just built the Copper Pole. At first it worked absolutely wonderfully, but now I am finding that it seems very sensitive to how the feed line runs off from the antenna. Small changes in the position of the wire (not the feed point itself; how the wire hangs) make very large changes in the antenna's effectiveness. Apparently, my first positioning was just right. Now, of course, things have moved and I can't find the "sweet spot" again.

One change I made was to add a short (1 foot) section of 3/4" pipe to the bottom of the "excess" 1/2" pipe, in order to fit the mounting bracket. My first positioning of the antenna didn't have this, and I wonder if the length of that 34" piece is important.

How is your antenna mounted? Did you ground the mounting pipe? Is it mounted on something metal (a mast of some sort) or something non-conductive?

I understand that J-pole antennas are inherently prone to feed line radiation, and my guess is that this is what is happening. I've tried coiling up some of the feed line at the feed point to decouple the line, but that seemed to make things worse.

Other than that, I have found it to be a nice, inexpensive, easy to build antenna. I've been able to work the RS-10 satellite using it, so I know it can work in spite of my difficulties.

Thanks,

Greg KD6KGW

Does anyone know of any Amatuer Clubs in Huntsville, AL. I am going there pretty soon and I want to join a club there. Please leave Email on them and how I can get in contact with them to join.

Thanks
Greg (KD4TVF)

* STS-57/SAREX NEWS *
====================
Mission: STS-57/Spacehab/EURECA-Retrieval Orbital Alt. 287 miles
Vehicle: Endeavour/OV-105 Inclination: 28 degrees
Location: Pad 39-B Crew Size: 6
Launch: 21-Jun-93 at 13:07:22 UTC
Expected KSC Landing Date: 29-Jun-93
Expected Mission Duration: 7 days/23 hours (if cryogenics allow)

The Shuttle Amateur Radio Experiment (SAREX) is activated and fully
operational on the Space Shuttle Endeavour. The initial engineering
contact with W5RRR went well. Pilot Brian Duffy's (N5WQW) family were
on hand at the JSC ARC during the pass. In fact, Duffy's son Shaun, KB5SIY,
initiated the contact for the engineering checkout.

Two orbits later, the students at the Mitchell Elementary School in Houston
had an outstanding, crystal clear contact with 11 students asking questions.

The school contact with the Lawrence Hall of Science and Malcolm-X
Intermediate School had limited success today on the following orbit with
2 students asking questions. An unfavorable Shuttle attitude limited SAREX
success during this pass.

SAREX and amateur radio, in general, received a big boost last week when
President Clinton had a telephone conference with the STS-57 crew. During
his address to the astronauts, President Clinton commended the astronauts,
the SAREX team and the amateur radio community for their outstanding
support to students around the world. Clinton said "I understand that
later in the mission Janice (Voss) and Brian (Duffy) are going to be
talking with school children around the world." He continued "But I want
to tell you how much I appreciate the fact that you're making an
international education project out of this mission. That's very important
to me." Pilot Brian Duffy responded "Mr. President, we find that using

amateur radio is an excellent way of communicating with children all around the world, and we're also able to excite them by using space and science. And letting them see space and science in action, we're able to excite them and hope they'll study harder." The President finished, "You have no idea -- you may be on this mission creating thousands of scientists for the future just by the power of your example and by this direct communication. I think sometimes we underestimate the impact that human contact in an enormously impressive setting like this can have on children all across the world -- not only those with whom you'll talk, but millions of others who will just see it and know that it happened."

This is the fourth flight of Space Shuttle Endeavour and the 56th flight of the Space Shuttle system.

* AMSAT-OSCAR-13 NEWS *
==========
The demise of Oscar-13's mode-L transmitter makes the 1993 schedules (published last November) obselete. Thus the AO-13 command team are reviewing the best way to schedule the remaining mode-S and mode-B transponders.

1. Mode-JL was very power hungry, consuming more than mode-B and mode-S combined. In order to maintain a full schedule, we used to be obliged to operate with the Sun angle less than 30 degrees (87% illumination). We can now run comfortably at up to about 40 degrees (77%), which means we can operate Earth pointing from apogee (Alon/Alat 180/0) for 1/3rd longer periods than hitherto.

2. Logically, mode-S can now assume time previously assigned to mode-JL.

So there is scope for more comprehensive use of mode-S, and the revised schedules will reflect this.

At certain times (such as now), the attitude is relatively extreme, and the amount of useful transponder time is very restricted. So any mode-S operation is necessarily short. 10 MAs represent about 1/6 th of the available time. When the attitude is Earth pointing from apogee, such as in the 3rd quarter of 1993, the mode-S exclusive period can be longer, mode SB can be invoked for some hours, and the S-beacon exercised.

At intermediate attitudes the schedule will be intermediate too. The exact mix will be the subject to power budgets, and as yet we have no real working knowledge of the conditions free of the heavy mode-L loading. So gathering data will take a little time.

In principle we want to guarantee a minimum of 10 MAs mode-S exclusive at all times, and under optimum attitude and Sun angle conditions invoke a maximum of 30 MAs, inclusive of beacon. Mode-BS operation will be in use whenever possible since it does not affect mode-B in the slightest, yet provides a useful test environment for mode-S experimenters.

Provisional plans will be released shortly.

It is worth reiterating that a 60 cm dish with a "noisy" 1.8 db noise figure down-converter is adequate for AO-13 mode-S reception, as indeed (just) is a 16 turn helix with a low noise 0.6 db NF device. This performance equates to a Gain/Temperature ratio G/T of 0.5 K^-1, or equivalently a Sun noise increase of about 1 db. These antennas are physically small, and will work indoors.

This opportunity to sample mode-S reception has never been bettered in amateur satellite history. Try it!

The active command stations are listed below, and constructive feedback about operations is always welcome.

Peter DB2OS @ DB0FAU
James G3RUH @ GB7DDX
Graham VK5AGR @ VK5WI

The above may also be reached via Internet (callsign@amsat.org) and UO-22. Please remember to state clearly a return address.

Notes prepared on behalf of, and in total cooperation with those listed by James Miller G3RUH 1993 Jun 11 [Fri].

The latest AO-13 schedule as of 25-Jun-93 follows:

L QST *** AO-13 TRANSPONDER SCHEDULE *** 1993 Jun 25 ->
Mode-B : MA 0 to MA 20 !
Mode-S : MA 20 to MA 30 !<- S transponder; B trsp. is OFF
Mode-B : MA 30 to MA 256 ! Attitudes Jun 25 130/0
Mode- : MA ! (approx) Jun 30 135/0
Mode- : MA ! Jul 05 140/0
Omnis : MA 170 to MA 10 ! Jul 15 145/0
! Jul 26 150/0

I have received many questions over the years regarding SpaceNews access through FTP via the Internet. While some FTP sites might be available that provide this service, the author is not aware of any.

Since there seems to be an interest in fetching SpaceNews across the Internet, I have decided to make SpaceNews available using the "finger" command.

Therefore, issuing the command: finger magliaco@pilot.njin.net should yield the latest copy of SpaceNews. Give it a try, and if there is enough interest, I will try to keep the current issue of SpaceNews available on this system for everyone.

You may leave your comments at: magliaco@pilot.njin.net, or send them via any of the other paths listed below.
